Responsible Humanitarian AI

Shared Principles, Divergent Practice:

*Humanitarian Practitioners and AI Experts in Colombia's
Migration Response*

Joshua Beretta

Supervisor: Dr Malcolm Campbell-Verduyn

University of Groningen

August 2026

This thesis is submitted for obtaining the Master's Degree in International Humanitarian Action. By submitting the thesis, the author certifies that the text is from his/her hand, does not include the work of someone else unless clearly indicated, and that the thesis has been produced in accordance with proper academic practices.

Abstract

Humanitarian organisations and practitioners are adopting Artificial Intelligence (AI) faster than they or the sector are able to govern its use. Ethical principles for AI exist, but they were largely developed before the general availability of Large Language Models (LLMs) since the launch of ChatGPT, and how they are operationalised in humanitarian practice by different stakeholder groups is not well studied. This research examines how interpretations of those principles diverge between those who build humanitarian AI tools and the humanitarian practitioners who use them. It draws on a mixed methods approach with eleven participants in Colombia's response to Venezuelan migration: seven humanitarian practitioners from local organisations in Colombia and four AI experts developing AI technologies. The interviews were analysed using the framework analysis method against six ethical principles merged from the Principled AI themes and United Nations Office for the Coordination of Humanitarian Affairs (OCHA)'s Humanitarian Data Ethics Guidance.

The two groups diverge significantly in how they operationalise the principles rather than in the values themselves. Both groups rate all six as highly important, although humanitarian practitioners interpret them through individual judgement, while AI experts do so from an institutional and sector level. Only the principle of *fairness* emerged as an opposed belief, with humanitarian practitioners seeing AI as a corrective to human bias and AI experts as a carrier of bias that can be mitigated but not eliminated. Both groups see AI use as largely inevitable and necessary to meet the scale of humanitarian need, but generally admit that the sector is not yet ready to operationalise it responsibly.

The research derives six components for bridging the two groups, presented as a starting point towards an empirically-grounded framework rather than complete in itself, and complements the recently published frameworks and guidance from the sector. This research aims to help move the study of AI ethics in humanitarian settings from the level of abstract principles to one of *operationalisation*.

Keywords: *humanitarian AI, responsible AI, AI ethics, LLMs, humanitarian principles, technocolonialism, low-resource languages, Colombia, Latin America, Global South*

... let's be honest, the biggest risk is the current status quo of humanitarianism completely falls short of what our call to action is [...]

Isn't inaction the biggest risk?

— EXP01-Q3-S1

Acknowledgements

I would like to thank my supervisor, Dr Malcolm Campbell-Verduyn, for their guidance and patience with me throughout this research, especially while I regularly pushed out my deadlines when work or another humanitarian response got in the way.

I owe significant thanks to Dr Tino Kreutzer for their mentorship, guidance, trust and support which has been invaluable to this research, and my career. Their own research and work in humanitarian technology has been a constant source of inspiration for my professional and academic career, and I am grateful for their encouragement to pursue this research and the flexibility they gave while I attempted to balance the masters programme with my position at Kobo. Dr Jerome Marston also deserves thanks for their mentorship and guidance in the early stages of this research.

This work would also not have been possible without the generous participation of the individuals in this study, especially the humanitarian practitioners who I was able to meet in person during my fieldwork in Colombia.

Finally, special thanks to my parents, Peter and Riana Beretta, for supporting my adventures and pursuits, wherever they have taken me, and for their encouragement to pursue my passions. And especially to my partner, Shantara Pintak, for their immense patience, support, comfort and love while I completed this research trying to balance work, study and life in general... and mostly failing to do so successfully.

Key Concepts

Algorithmic Bias: The reproduction and amplification by an AI system of the historical, social and representational biases embedded in its training data, producing outputs that can systematically disadvantage particular groups and reinforce existing inequalities (Bender et al., 2021).

Automation Bias: The human tendency to over-trust automated output and defer to a machine recommendation even where evidence is available to verify or contradict it (Pizzi et al., 2020; Romeo & Conti, 2026).

Do No Harm: The humanitarian obligation that an intervention must not cause harm to the people it is meant to assist.

Hallucination: The tendency of LLMs to produce outputs that are factually incorrect or unsupported by any source, and which is difficult to detect without independent verification because it is interwoven with accurate content (Bender et al., 2021; Perković et al., 2024).

HITL – Human-in-the-Loop: A process in which a person reviews, approves or can override an automated output from an AI system.

Humanitarian Principles: The four principles guiding humanitarian action: humanity, neutrality, impartiality and independence. Quoted in full in Table 1.

LLM – Large Language Model: A generative AI system trained on large bodies of text and capable of drafting, translation, summarisation and conversation. Current models are multi-modal, allowing them to additionally process and generate images and audio.

Low-Resource Language: A language for which little digital text or speech data exists, resulting in minimal training data for LLMs and other AI systems and therefore poor performance on tasks such as translation, summarisation or speech recognition.

Shadow Use: Undisclosed or unsanctioned use of AI tools by staff, outside whatever policy or oversight their organisation has (Humanitarian Leadership Academy & Data Friendly Space, 2025; McElhinney et al., 2026).

Technocolonialism: Madianou’s concept for the way digital innovation in humanitarian contexts reproduces and entrenches colonial-era asymmetries rather than correcting them (Madianou, 2019a; 2021b).

1 Introduction

1.1 Problem Statement

1.1.1 Converging crises and the rise of AI in humanitarian assistance

The increasingly resource constrained environment in the humanitarian sector is driving organisations and humanitarian workers to explore technological solutions to fill gaps in their operations and meet the growing needs of affected populations. The integration of AI technologies, particularly LLMs, into humanitarian operations represents a significant shift in how assistance may be delivered, offering new possibilities for reporting, communication, decision-making, data collection and analysis, and more. However, this shift is also a fundamental change in risk exposure as these new technologies are adopted without fully understanding limitations and ethical implications of their use.¹

Pre-ChatGPT, AI technologies operated primarily in the background through specialised technical systems — predictive analytics, Natural Language Processing (NLP), CV, and data processing tools — managed by technical professionals who understood the underlying limitations and biases (at least better than the layman). Post-ChatGPT however, AI (in the form of LLMs) has moved into the hands of anyone with a smartphone and an internet connection, becoming accessible conversational interfaces used directly by non-technical humanitarian practitioners for communication with donors and affected populations, decision-making support, and sensitive data analysis.

1.1.2 Misalignment of ethical principles and risk exposure

LLMs are predominantly developed by for-profit technology companies and researchers based in the Global North, operating within commercial incentive structures — structures that don't account for the specific needs, vulnerabilities, or legal contexts of humanitarian operations in complex settings. Furthermore, the data used for model training lacks the nuance and representation of the specific contexts in which these tools are being deployed, particularly in low-resource, non-English language environments outside of the Global North. Terms of use are often

¹Although AI is a broad field encompassing various techniques and applications, such as Machine Learning (ML), Computer Vision (CV), Reinforcement Learning (RL), robotics, and more, this research focuses specifically on the emerging implications of using LLMs, therefore references AI will generally refer to LLMs unless stated otherwise.

opaque and user data is often used for further model training. Other risks can be subtle and hard to detect and mitigate for both experts and non-experts resulting in a lack of transparency and accountability for the consequences of these tools when they fail, mislead or cause harm.

Furthermore, developers of AI tools likely have limited understanding of the humanitarian principles, the challenges of complex humanitarian contexts, or the consequences when their tools affect vulnerable populations. On the other hand, humanitarian practitioners using these tools may lack the technical and AI literacy to evaluate the opportunities and tangible risks their operations. This reveals a gap between those who build the tools and those who use them, resulting in compounding risk for the vulnerable populations at the centre of humanitarian response — who lack insight into decisions being made about their access to assistance, and meaningful recourse when those systems fail.

The increasing reliance on new, LLM-based technologies raises critical ethical questions, especially in high-stakes contexts involving migrants and displaced persons who face unique vulnerabilities and politically charged contexts. The democratisation of AI means that humanitarian practitioners are now directly exposing these vulnerable populations to AI-related risks without necessarily understanding the implications of their choices.

1.1.3 A focus on Colombia and migration contexts

Although this is a complex issue not confined to a single humanitarian or national context, Colombia is a particularly relevant case study. The country hosts by far the largest population of Venezuelan refugees and migrants in the region — approximately 2.84 million as of April 2026, almost twice that of the next highest in Peru with 1.63 million (R4V, 2026) — due to its geographic proximity and the complex political and economic instability in Venezuela, which has caused mass displacement across the region since 2015. The Latin American humanitarian response is coordinated through the Response for Venezuelans (R4V) platform, jointly lead by United Nations High Commissioner for Refugees (UNHCR) and International Organization for Migration (IOM), and its national coordination mechanism in Colombia, Grupo Interagencial sobre Flujos Migratorios Mixtos (GIFMM), which coordinates International Non-Governmental Organizations (INGOs), Non-Governmental Organizations (NGOs), and Civil Society Organiza-

tions (CSOs).²

Funding cuts from the United States (US) and other donors have hit Colombia particularly hard (although it is also felt across the region) — US support for the Refugee and Migrant Response Plan (RMRP) fell from \$383 million to just \$44 million in 2025, while direct US assistance to Colombia dropped from \$134 million to \$9 million over the same period (Council on Foreign Relations, 2025). This has resulted in reduced international operations from United Nations (UN) agencies, and forced many INGOs, national organisations, and CSOs to cut staff, suspend services, or close entirely, leaving significant gaps in assistance for migrants and displaced populations. It is in this environment — one defined by a widening gap between humanitarian need and available resources — that AI tools are being actively explored and piloted to help extend organisational reach. And it is here where the consequences of misuse or failure of these tools could be most severe.

Ethical principles for AI implementation exist, but how they are operationalised in practice in humanitarian contexts is not well studied. And differences in how these abstract principles are interpreted and applied across stakeholder groups such as AI experts and humanitarian practitioners can compound risks for the most vulnerable.

1.2 Research Question

This research examines how ethical principles for implementing AI technologies, particularly LLMs, are differently interpreted and applied by humanitarian practitioners in Colombia and by developers of humanitarian AI tools — focusing on the potential deployment of these tools to support Venezuelan migrants and other displaced populations, and investigating how each group prioritises and balances these principles in their risk-benefit assessments. The thesis aims to answer the following Research Question (RQ):

RQ. How do interpretations of ethical principles for AI implementation diverge between humanitarian AI developers and humanitarian practitioners?

1.2.1 Sub-Questions

This research explores the following Sub-Questions (SQs), referred to throughout as SQ1, SQ2 and SQ3:

²R4V is an inter-agency platform coordinating the regional response to Venezuelan displacement across Latin America. See <https://www.r4v.info>

- SQ1.** How do humanitarian organisations in migration contexts in Colombia currently apply ethical principles in their technology use, and how does this compare with how the developers of humanitarian AI tools apply them?
- SQ2.** What differences exist in how each group prioritises and understands the merged ethical principles from OCHA’s Humanitarian Data Ethics Guidance and the Principled AI approach?
- SQ3.** What *practical frameworks* could bridge these different perspectives to guide responsible AI implementation that respects both humanitarian principles and addresses ethical concerns?

1.3 Aims and Research Objectives

This research aims to provide practical insights to guide responsible implementation, helping humanitarian practitioners leverage AI’s potential, particularly LLMs, while mitigating — or at least reducing — the potential risks. Through analysing different perspectives and priorities of humanitarian practitioners and AI experts, this research aims to lay some of the groundwork for developing new or assessing existing frameworks that can balance ethics with reality.

Although the research in this thesis is focused on a specific region and context, the insights and outputs and recommendations aim to be applicable to similar contexts, particularly in low-resource, non-English language settings, outside of the Global North, where the consequences of AI use are often heightened.

1.4 Research Relevance and Existing Gaps

The academic relevance of this research lies in addressing a gap in the literature in how abstract ethical frameworks focused on AI are interpreted and implemented in humanitarian contexts. While extensive literature exists on theoretical frameworks and potential risks of AI in various settings (Fjeld et al., 2020; Hagendorff, 2020; Jobin et al., 2019; Mittelstadt, 2019), less attention has been paid to how these frameworks, and the principles within them, are understood and operationalised by different stakeholders in humanitarian contexts, particularly in migration settings outside Western-dominated perspectives and the English language. Building on a history of digital ethics research spanning big data, computational ethics, and humanitarian technology frameworks, this thesis positions the frameworks from UN OCHA (2020) and Fjeld et al. (2020) in the post-ChatGPT era.

Kreutzer et al. (2025) also identify the literature gap since ChatGPT came onto the scene, and the urgent need for research considering the real risks that vulnerable populations are exposed to in humanitarian contexts with AI use, noting:

The underrepresentation of perspectives from low and middle-income countries in the academic discourse further exacerbates these challenges, highlighting the urgent need for more diverse and inclusive perspectives. Additional research, especially using empirical methods, is necessary to better identify and understand the type and prevalence of ethical issues in the field.

— (Kreutzer et al., 2025, p. 15)

Beyond academia, the omissions in policy are also significant, as Beretta (2025a) pointed out with regards to the lack of governance frameworks in the strategic direction of Global Protection Cluster (GPC) for 2025–2030 (GPC, 2025), noting that the “potential for systematic rights violations, discrimination, and erosion of protection principles for vulnerable populations at a massive scale is something that the humanitarian sector cannot afford to ignore” (Beretta, 2025a, pp. 11–12). This is not limited to the GPC as the humanitarian sector more broadly is grappling with how to manage the emergence of AI-related risks in practice. Policies are being developed at regional and international levels within the European Union (EU) and US, and the UN is taking an increasingly active role in shaping the global governance of AI, but it is not well understood how this reaches humanitarian actors operating in complex, high-risk contexts as usable guidance. The onus is largely being left to organisations, or individuals within them, to figure out their own approaches in isolation.

Asymmetries of power and the lens of *technocolonialism* from Madianou (2019a), which is largely absent from the AI and data ethics literature, is explored beyond the AI and data frameworks, and together these topics are elaborated in Chapter 2.

1.5 Methodology Overview

This research adopts a pragmatist approach to investigate how humanitarian principles merge with AI ethics in practice, particularly the eight key themes that Fjeld et al. (2020) identified across various AI ethics frameworks: (i) *privacy*,

(ii) *accountability*, (iii) *safety and security*, (iv) *transparency*, (v) *fairness*, (vi) *human control of technology*, (vii) *professional responsibility*, and (viii) *promotion of human values*. The analysis draws on the complementary Humanitarian Data Ethics Guidance from UN OCHA (2020) to incorporate the humanitarian principles perspective of the sector. For the purposes of this thesis, Fjeld et al. (2020)’s eight themes are consolidated into six working principles, as laid out in Section 2.2.1.

OCHA’s guidance takes a humanitarian perspective but predates the LLM era and does not address the specific risks this introduces, while the analysis by Fjeld et al. (2020) captures a wide perspective on AI framework development but is not grounded in humanitarian contexts or the post-ChatGPT era.

Synthesising the two, they provide a lens to compare how stakeholder groups of humanitarian practitioners and AI experts interpret and prioritise the same underlying principles within the new LLM technological reality.

1.5.1 Approach and Methods

This research uses a mixed-methods, Key Informant Interview (KII) approach to combine qualitative semi-structured interviews with a quantitative self-assessment. Participants were selected through snowball sampling across two groups:

- i. Humanitarian practitioners from local and community-based organisations in Colombia supporting migrants, and
- ii. AI experts involved in developing LLM technologies with potential humanitarian applications.

A summary of the participant sample and interview method is provided in Table 3.

Both groups were asked the same core Open-ended Questions (OEQs) organised around the six merged ethical themes drawn from Fjeld et al. (2020), UN OCHA (2022) and additional cross-cutting themes (see Table 4). The self-assessment asked participants to rate, on a scale of 1–10, the relative importance of each ethical principle, how attentive they considered the field is to that principle, and who they considered to be primarily responsible for upholding or enforcing it (see Table 5).

Qualitative data were analysed using framework analysis, an approach developed for applied policy research (Gale et al., 2013; Ritchie & Spencer, 2002), and the quantitative data analysed through descriptive methods, the results of both integrated for interpretation. The full methodological detail, including sampling

and analytical methods is elaborated in Chapter 3, and the findings presented in Chapter 4.

1.6 Structure of the Thesis

Following this introduction, Chapter 2 establishes the theoretical framework. It reviews the two strands of AI and humanitarian principles alongside the critical literature on power in humanitarian technology through the lens of *technocolonialism*. The first two are then synthesised into a merged framework of six ethical principles (see Section 2.2.1), which serves as both the analytical lens of the study and the coding scheme for the analysis in Chapter 4 and discussion in Chapter 5.

Chapter 3 details the methodology used in this study: mixed-methods, KII research design, the snowball sampling and profile of the two participant groups, the interview and self-assessment instruments, and the framework-analysis procedure used to code the interviews against the six principles. Chapter 4 presents the findings of the quantitative self-assessment and the qualitative framework analysis, integrating them in Section 4.2.5 to derive the nine core findings and six components of a proposed bridging framework (see Section 4.2.6). Chapter 5 takes the findings in context with the literature review from Chapter 2, answering the RQ and its three SQs (see Section 5.1), and then develops the implications for practice that follow (see Section 5.2). Finally, Chapter 6 summarises the research questions and core findings, and sets out the contribution this research aims to make, its limitations, and recommendations for humanitarian organisations, AI developers, the sector and directions for future research (see Section 6.4).

2 Theory

2.1 Literature Review

This study integrates the well-established humanitarian principles that have guided the humanitarian action for decades, and the ethical principles for AI to establish a theoretical frame for operationalisation of responsible AI use in humanitarian contexts. This chapter reviews the existing AI ethics literature which largely converges on recurring themes (Section 2.1.1). It goes on to survey limitations of AI in light of this (Section 2.1.2), humanitarian ethics (Section 2.1.3), and a critical account of power drawing on the *technocolonialism* literature of Madianou (2019a) (Section 2.1.4). There are two limitations that emerge as a general thread through the literature: existing work largely predates generally available LLMs since the launch of ChatGPT, and none compares how humanitarian practitioners and AI experts interpret or operationalise AI principles in practice.

2.1.1 AI Ethics: From Principles to Practice

The past decade has seen what Fjeld et al. (2020, p. 3) describe as a “proliferation of principles” documents intended to provide normative guidance for AI systems, authored by governments, companies, professional associations, advocacy groups, and multi-stakeholder initiatives. Through the study, their purpose is to “capture the benefits and reduce the harms of AI technology as it continues to be developed and deployed around the globe.” They analysed thirty-six prominent AI principles documents and found that there is significant convergence around eight key themes: (i) *privacy*, (ii) *accountability*, (iii) *safety and security*, (iv) *transparency and explainability*, (v) *fairness and non-discrimination*, (vi) *human control of technology*, (vii) *professional responsibility*, and (viii) *promotion of human values*. Furthermore, they found it “striking” that more recent documents tended to address all eight themes, suggesting that there is now the emergence “normative core” for a principle-based approach to AI governance (Fjeld et al., 2020, p. 5).

Hagendorff (2020) sees a similar emergence of core principles, finding that what occurs in 80% of the guidelines they analysed is accountability, privacy, and fairness. They argue that these principles are the “most easily operationalized mathematically” and for which “technical fixes can be or have already been developed” (Hagendorff, 2020, p. 103). Agreeing with Mittelstadt (2019), however, they point out the limitations of principles in practice, cynically noting that “in

cases where ethics is integrated into institutions, it mainly serves as a marketing strategy”, and that it appears as though the “purposes for which AI systems are developed and applied are not in accordance with societal values or fundamental rights such as beneficence, non-maleficence, justice, and explicability” (Hagendorff, 2020, p. 113–114).

A parallel meta-analysis by Jobin et al. (2019, p. 8) also found that there is notable convergence of principles, but grouped them by: transparency, justice and fairness, non-maleficence, responsibility, and privacy. They also noted, agreeing with Hagendorff (2020), that there is “substantive divergence” in how these principles are interpreted, why they are considered important, and how they should be implemented in practice. Neither, Fjeld et al. (2020) nor Jobin et al. (2019), however, focus their analysis on humanitarian issues directly, Jobin et al. only referring in passing to AI’s potential to alleviate suffering, and Fjeld et al. not at all. Furthermore, both studies, including Hagendorff (2020), were conducted before the widespread availability of general-purpose LLMs, and so do not address the specific risks and failure modes that have emerged in the post-ChatGPT era. That is not to say they are now irrelevant, but that they require careful review and updating to account for the new technological environment.

Kreutzer et al. (2025) takes a similar frame to Jobin et al. (2019) but with more of a humanitarian focus and, being more recent, taking LLMs into account. They use the same four bioethical principles of autonomy, beneficence, non-maleficence, and justice to group 22 core ethical issues identified in their scoping review of 218 studies on humanitarian data processing in humanitarian crises, discussed below in Section 2.1.2. Strikingly, they find that the current “humanitarian data protection guidance as well as training and accountability methods for monitoring potential harm and to limit risks are insufficient to address all concerns identified,” and note that the “guidelines and mechanisms will need to be reviewed, expanded, and informed by regular reviews that keep pace with technological change and changes in practice” (Kreutzer et al., 2025, p. 16).

Despite the apparent emergence of a shared framework for analysis or the development of guiding principles for AI and data ethics, there is a clear gap between theory and practice — and one that is likely widening in the post-ChatGPT era. Mittelstadt (2019) argues that the convergence of AI ethics on a small set of high-level, abstract principles is actually a misleading sense of agreement and falls short of what is needed in practice. Unlike medical ethics,

which Kreutzer et al. (2025) base their framing on, Mittelstadt (2019, p. 1) points out that AI development lacks “common aims and fiduciary duties,” a shared “professional history and norms,” “proven methods to translate principles into practice,” and “robust legal and professional accountability mechanisms.” As a result, the apparent consensus in these emergent principles hides a “deep political and normative disagreement” that lies under the surface.

Fjeld et al. themselves caution that principles are “a starting place for governance, not an end,” and that their impact depends on being embedded in a wider ecosystem of laws, regulations, and “professional practices and everyday routines.” Fjeld et al. (2020, p. 66) qualify their synthesis, noting that “there’s a wide and thorny gap between the articulation of these high-level concepts and their actual achievement in the real world.” Mittelstadt agrees with this, concluding that despite the shortfall of what is needed for responsible AI use, ethics “is a process, not a destination” with a call to action that we must “translate and implement our lofty principles, and in doing so to begin to understand the real ethical challenges of AI.” They caution that “insufficient consideration of ethics leads to poor design decisions which create systems that harm users.” In humanitarian contexts, the “users” here are often the most vulnerable, and the harm caused may be extreme.

This is largely the motivation for the empirical work in this thesis: to understand, and quantify, how these concepts are interpreted and operationalised in practice, specifically in humanitarian contexts. Kreutzer et al. (2025) sum up the motivation and urgency well in their concluding call to action:

Finally, investigations are urgently needed into early adoptions of AI tools in humanitarian contexts, including the rapid spread of large language models such as ChatGPT, to ensure these technologies are harnessed with utmost ethical rigor, safeguarding the dignity and rights of those in crisis while enhancing the efficacy and fairness of humanitarian responses.

— (Kreutzer et al., 2025, p. 16)

2.1.2 AI Risks and Failure Modes

Using guiding principles discussed above, even with apparent consensus on broad themes, can only be seen as a starting point for responsible AI practice, as Mittelstadt (2019) argues. Abstract principles need to be understood and grounded in

light of the limitations and failure modes of AI systems, and LLMs in particular as is the focus of this thesis. Beduschi (2022, p. 1149), in investigating the opportunities and risks of AI in humanitarian contexts, concludes that the “existing risks, including those relating to algorithmic bias and data privacy concerns, must be addressed as a priority if AI is to be put at the service of humanitarian action and not to be deployed at the expense of humanitarianism.” Beduschi proposes a path from principle to practice, noting that “risk analysis and impact assessments may help to operationalize the ‘do no harm’ imperative.” Through these assessments, the result may be “that no technologies should be deployed in a specific context, as these would cause more harm than good to their beneficiaries”, since “the fact that a technology is available does not mean that it must also be used” (Beduschi, 2022, p. 1164).

Kreutzer et al. (2025) provides the most comprehensive empirical mapping of AI risks in humanitarian contexts through a scoping review of 218 peer-reviewed studies, published between 2010 and August 2024 — therefore also overlapping with the post-ChatGPT period. They identify 22 ethical issues emerging from this analysis, grouped into the categories of autonomy, beneficence, non-maleficence, and justice. They chose to apply principles from Beauchamp et al. (2019), directed towards medical ethics, rather than the humanitarian principles, which Kreutzer et al. note have proven difficult to apply in practice (Kreutzer et al., 2025, p. 3). They find that non-maleficence, and privacy specifically, is the most-cited issue, followed by biased processing, under the category of justice, that distributes assistance disproportionately to need. Strikingly, they find that almost half the studies in their analysis grounded their concerns in real incidents rather than hypotheticals, noting that this implies ethical issues have “moved from theoretical concerns to actual incidents” (Kreutzer et al., 2025, p. 13).

Highlighting the power asymmetries, they find that nearly half the studies raised the issue of humanitarian data processing’s dependence on politically, commercially, or militarily interested external entities. Data processing is a “cross-cutting issue” that has the potential “to exacerbate power imbalances,” noting that 43% of studies found that processing further entrenches the power dynamics between these entities and the affected populations (Kreutzer et al., 2025, p. 12). Mittelstadt (2019, p. 7) puts this in the context of AI’s misaligned incentive structures: “Unsurprisingly, ethical considerations may be discarded when they conflict with commercial incentives. It cannot be assumed that value-conscious

frameworks will be meaningfully implemented in commercial processes that value efficiency, speed, and profit.”

In this thesis, the theme of power is explored through Madianou (2019a)’s lens of *technocolonialism* in Section 2.1.4. They argue that the use of digital technologies in humanitarian contexts can reproduce and entrench colonial-era asymmetries between the Global North and the displaced populations who become the “subjects” of data extraction and experimentation (Madianou, 2019a).

On specific failure modes, a well documented risk in AI and LLMs is *algorithmic bias*. These systems “learn” patterns from their training data, reproduce, and can amplify the historical, social, and representational biases embedded in that data, producing outputs that systematically disadvantage particular groups. Beduschi (2022, p. 1155) raises this issue, noting that “AI systems focusing on the analysis of past data might continue to reproduce errors and inaccuracies and perpetuate historical inequalities, biases and unfairness.” Digital Humanitarian Network (2023, p. 8) add that as organisations scale “their models for novelty, performance, and efficiency, they risk scaling biases, disinformation, and inaccuracies in generated data.” It is well documented that AI systems have been known to discriminate against gender and minority groups (Beduschi, 2022; Bender et al., 2021; Kreutzer et al., 2025, p. 10; Pizzi et al., 2020). Bender et al. (2021) provides some specific examples of this:

Biases can be encoded in ways that form a continuum from subtle patterns like referring to women doctors as if doctor itself entails not-woman or referring to both genders excluding the possibility of non-binary gender identities, through directly contested framings (e.g. undocumented immigrants vs. illegal immigrants or illegals), to language that is widely recognized to be derogatory (e.g. racial slurs) yet still used by some.

— (Bender et al., 2021, p. 617)

Communities in humanitarian need are often displaced people, linguistic minorities, vulnerable groups, politically oppressed, or all of the above and more. They are often under-represented in the predominantly English-language, Global North data on which large models are trained, so that systems perform least reliably for those who can least afford the error (Li et al., 2025; Myung et al., 2024). Algorithmic bias directly touches on the principle of *fairness* and, through

it, on the humanitarian principle of impartiality. This is discussed later, in the context of the data collected during this research, in Section 5.2.5.

A related risk to algorithmic bias, but one distinctive to generative AI (GenAI), that is LLMs, is what is termed *hallucination*. This is the tendency of LLMs to produce fluent, confident output that is factually incorrect, fabricated, or unsupported by any source (Bender et al., 2021; Perković et al., 2024). This creates an environment ripe for misinformation, manipulation and the reinforcing of existing biases, which in turn may result in further skewed training data for LLMs, and therefore a dangerous feedback loop (Digital Humanitarian Network, 2023). The generative nature of LLMs is a feature, resulting in many tasks — such as drafting, translation, code generation, etc. — being handed over to these systems, but false information interwoven with accurate information is difficult to detect without independent verification. As LLMs have become multi-modal, that is they are able to generate and process text, images, and audio, hallucinations can occur across all these modalities, and can be difficult to detect in any of them, either by humans or machines (Leng et al., 2026).

The risk compounds in high-stakes settings, such as in humanitarian contexts, where a plausible fabrication can cause direct or indirect harm, and where models fail in ways that go beyond factual error. Moore et al. (2025) find that current LLMs express stigma towards people with mental-health conditions and encourage rather than challenge delusional thinking, noting that the models “do not always respond appropriately or safely to our stimuli, where an inappropriate response might include encouragement or facilitation of suicidal ideation” (p. 7). Hallucination touches on the principles on *safety and security* and on *transparency*, since the opacity and “black box” nature of these systems makes it hard to know when their output can be trusted (Bathae, 2017; Pizzi et al., 2020).

Beyond risks posed by the models themselves, there are risks associated with the adoption of commercial AI services, which involve the transfer to and processing of data by a third parties. ICRC (2024) cover this in detail in their *Handbook on Data Protection in Humanitarian Action*, outlining the risks of using commercial providers and means of protecting humanitarian data. They warn that providers in locations such as the US may be compelled to disclose data on national-security grounds, naming the US PATRIOT Act and the Foreign Intelligence Surveillance Act under which a humanitarian organisation’s data “might be vulnerable to disclosure requests” (ICRC, 2024, p. 175). The main providers

of frontier LLMs are concentrated in the US, such as Google, Anthropic, Meta and others, so data being sent to these services for humanitarian purposes are potentially putting vulnerable populations at greater risk.

Beyond forced disclosure, data shared to these providers may be used to further train their models, something Digital Humanitarian Network (2023, p. 10) highlights, and note that while providers often allow for users to opt out of their data being used for model training, the companies themselves “still acknowledge potential risks and recommend not sharing any confidential or sensitive information with their tools. Data privacy and security becomes even more challenging with third party plugins built on top of such chatbots, as the data protection rights from the main AI companies may not apply.” Opting out of model training is not the default for most providers, especially on free tiers, and the resulting downstream data processing is often opaque. Dodgson et al. (2020), ICRC (2024) and Digital Humanitarian Network (2023), McElhinney et al. (2026) and others note the further ethical concern of consent to re-use and processing of collected data, additionally without the ability for affected populations to opt out themselves. This is only compounded when sensitive Personally Identifiable Information (PII) data such as biometric information is collected, which is increasingly the case in humanitarian contexts by organisations such as World Food Programme (WFP), UNHCR and others (The Engine Room & Oxfam, 2018). These risks directly relate to the principles of *privacy* and *safety and security*, and are discussed later in Section 5.2.6.

Compounding the risks discussed above is the human tendency towards *automation bias*. This is a well-documented behaviour of overly trusting automation, deferring to a machine recommendation even when evidence is available to verify or contradict the outputs. Romeo & Conti (2026, p. 259) find this effect goes beyond trust and is dependent on other interacting and cross-cutting factors such as “AI literacy, level of professional expertise, cognitive profile, developmental trust dynamics, task verification demands, and explanation complexity.” Pizzi et al. (2020, p. 155) agree with Romeo & Conti (2026), noting that these dynamics “result in a tendency to incorrectly interpret a system’s output, overestimate its predictive capacity or otherwise over-rely on its outputs, such as by allowing the system’s ‘decisions’ to supersede human judgement.” Romeo & Conti (2026), Pizzi et al. (2020) and McElhinney et al. (2026) highlight the critical role of explainability in AI outputs so that verification is even possible in the first place, with

Steyvers & Kumar (2024, p. 727) noting that “the task of developing interpretable and explainable AI that can make the process by which the AI generates advice apparent is key to establishing a productive working relationship between humans and AI.”

Steyvers & Kumar (2024) emphasise that for automation bias to be reduced, humans need to understand when AI systems should and should not be used, and for the AI models to reduce cognitive overload on the decision makers. Human-in-the-Loop (HITL) is often proposed as a solution to the risks AI and LLMs pose (Digital Humanitarian Network, 2023), but with the overarching human tendency towards automation bias, human oversight provides little real protection against model bias, hallucination or other failure modes, and it becomes a rubber-stamping exercise rather than a safeguard. Dodgson et al. (2020, p. 33) makes the same point, that even decisions “which are not entirely automated, i.e. ones with human-in-the-loop, still risk having humans make decisions based on evidence produced by data processed through AI.” This risk speaks directly to the principles of *human control*, *transparency* and *professional responsibility*.

The risks and failure modes discussed above are not exhaustive, but they illustrate the interaction between the principles of Fjeld et al. (2020) and UN OCHA (2022), and how they might impact responsible AI use in humanitarian contexts. This is becoming increasingly important as AI systems and LLMs shift into what is termed “agentic” AI, where AI moves further into the background and increasingly automated without strong oversight or meaningful controls. Li et al. (2026) show that, even in 2026, it is still difficult to measure, evaluate and reliably constrain the behaviour of these systems which are seeping into all areas of work and life. These risks are discussed later in Chapter 5 with the context of the empirical data collected in this study.

2.1.3 Humanitarian Principles and Data Ethics

The AI principles and risks discussed above need to be grounded in the humanitarian principles that have guided the provision of assistance and protection for decades. OCHA quotes Hugo Slim, noting that humanitarian ethics “has developed as a principle-based ethics [...] grounded in the principles of humanity, impartiality, neutrality and independence that have been developed to guide the provision of humanitarian assistance and protection” (Slim, 2015, p. 40; UN OCHA, 2020). These four principles of *humanity*, *impartiality*, *neutrality*, and *independence* (see

Table 1) are core to international humanitarian action and are codified in documents such as the Sphere Handbook,³ the Core Humanitarian Standard,⁴ and the Red Cross/NGO Code of Conduct⁵ (UN OCHA, 2020).

Principle	Definition
Humanity	Human suffering must be addressed wherever it is found. The purpose of humanitarian action is to protect life and health and ensure respect for human beings.
Neutrality	Humanitarian actors must not take sides in hostilities or engage in controversies of a political, racial, religious or ideological nature.
Impartiality	Humanitarian action must be carried out on the basis of need alone, giving priority to the most urgent cases of distress and making no distinctions on the basis of nationality, race, gender, religious belief, class or political opinions.
Independence	Humanitarian action must be autonomous from the political, economic, military or other objectives that any actor may hold with regard to areas where humanitarian action is being implemented.

Table 1: The four humanitarian principles. Source: UN OCHA (2022)

The humanitarian principles, however, “cannot simply be applied in practice across the complex range of settings where humanitarians deliver assistance” (UN OCHA, 2020, p. 3). Slim (2015, p. 115) notes that the principles “are typically interpreted from within a situation. Humanitarian ethics is, therefore, about struggling to interpret ethical limits and balancing various principles.” Kreutzer et al. (2025, p. 3) follow on this thread to highlight that “studies have shown the difficulty of applying these humanitarian principles in everyday practice, in guiding the use of information technology, or in mapping humanitarian organizations’ ethical obligations”, and that “the broad humanity ‘principle’ has been argued as being better understood as an absolute moral value rather than an ethical principle.” McElhinney et al. (2026, p. 10) note the same challenge, that “applying these principles to AI systems requires interpretation, as AI can introduce risks that are relational, indirect, distributed, or difficult to observe or verify, even when intentions are humanitarian.” Therefore, in this thesis, the humanitarian principles are treated as cross-cutting through the principles of Fjeld et al. (2020), comple-

³The Sphere Handbook sets out minimum standards for humanitarian response across various core sectors. See <https://spherestandards.org/handbook/>

⁴The Core Humanitarian Standard on Quality and Accountability. See <https://www.corehumanitarianstandard.org>

⁵The Code of Conduct for the International Red Cross and Red Crescent Movement and NGOs in Disaster Relief (1994). See <https://www.ifrc.org/document/code-conduct-international-red-cross-and-red-crescent-movement-and-ngos-disaster-relief>

menting them rather than additional coding categories, similar to the approach of Dodgson et al. (2020).

OCHA argues that “existing frameworks for humanitarian ethics must be expanded to enable staff and organizations to navigate the challenges and opportunities of the digital age” (UN OCHA, 2020, p. 1). They draw on the work of Floridi & Taddeo (2016, p. 3), who define data ethics “as the branch of ethics that studies and evaluates moral problems related to data (including generation, recording, curation, processing, dissemination, sharing and use), algorithms (including artificial intelligence, artificial agents, machine learning and robots) and corresponding practices (including responsible innovation, programming, hacking and professional codes), in order to formulate and support morally good solutions (e.g. right conducts or right values).” This definition is relevant for this study as it encompasses the principles and risks discussed above as they relate to AI and LLMs.

OCHA list the common ethical concerns in data management as “fairness, validity, bias, ossification, transparency and explainability, anonymity, privacy, and ownership of data and insights” (UN OCHA, 2020, p. 4). Most of these map closely onto the AI ethics themes from Fjeld et al. (2020), however, *ossification*,⁶ does not, and is the concern that comes closest to the topic of power discussed later in Section 2.1.4. Alongside these, OCHA list dilemmas they see in data-related projects, among them the “potential harmfulness or maleficence of humanitarian action,” “difficulties in association,” “complicity and moral entrapment,” “duties of care towards humanitarian staff,” and the “cost-effectiveness conundrum” (UN OCHA, 2020, p. 5).

This makes OCHA’s guidance a natural bridge between the general AI principles discussed earlier and the humanitarian principles of concern in the focus of this study. The guidance, however, shares the same limitation of the AI ethics syntheses above from Fjeld et al. (2020) as it predates the ChatGPT era, and its worked examples focus on field-level data collection and specialised predictive AI models rather than consumer-facing LLM tools that humanitarian practitioners now use on a daily basis. The framework developed by Dodgson et al. (2020), within the Humanitarian Data Science and Ethics Group (DSEG), which is a group of data scientists, humanitarians and ethics advocates, also surveys the

⁶OCHA define “ossification” as whether a model or its data is “codifying the current state of the world and thereby making it harder to change” (UN OCHA, 2020, p. 2)

principles of Fjeld et al. (2020) and the humanitarian principles through UN OCHA (2022)’s guidance document, but it similarly predates the LLM era and is focused on advanced data science rather than general-purpose tools and does not address the group of humanitarian practitioners. The DSEG group has also paused its work and is no longer producing further guidance or maintaining their framework published in 2020.⁷

Since the emergence of widely available and capable LLMs, a small number of guidance documents and frameworks aimed at humanitarian organisations and practitioners have been published. Digital Humanitarian Network (2023) published one of the first guidance documents focused on GenAI for humanitarians, but remains thin on operationalisation and does not provide a detailed framework for assessing risk or responsible use, but rather have a set of rules of thumb and recommendations for practitioners.

In 2026, more detailed and rigorous frameworks have started emerging, such as Standards and Assurance Framework for Ethical AI (SAFE AI), published by the Communicating with Disaster Affected Communities (CDAC) Network with the Alan Turing Institute and Humanitarian AI Advisory (McElhinney et al., 2026). It sets out a governance layer for organisations deploying AI in humanitarian contexts, built around proportionate, risk-tiered assessment, a staged project journey with decision gates, community co-design, and independent assurance. No research yet exists on how their framework is used in practice, and it is not clear how the principles they set out map onto the practitioner reasoning examined in this study. A second, narrower document followed SAFE AI two months later in July 2026: *From Hype to Due Diligence*, published by the NetHope Center for the Digital Nonprofit. In it, Mandefro (2026) lists 72 pre-AI-adoption assessment questions grouped around the six PESTLE (Political, Economic, Social, Technological, Legal, Environmental) dimensions, marking each question with who should answer it and what level of importance it carries. As with SAFE AI, no research yet exists on how their framework is used in practice. Both documents also post-date the interviews conducted for this study, so neither could have informed how the participants responded, and neither is evaluated in depth in this thesis but rather put forward for future research (see Section 6.4).

⁷This was confirmed in private correspondence with the group in January 2026, who noted: “Unfortunately the DSEG work is presently paused.”

2.1.4 Technocolonialism, Power and Asymmetries in Humanitarian Technology

The AI frameworks discussed in Section 2.1.1 are generally lacking on questions of power: they describe what ethical AI should look like in the ideal, but not whose interests it tends to serve or the power dynamics being reinforced in the process. Fjeld et al. (2020, p. 50) do mention the issue of power under their principle of *Fairness and Non-discrimination*, quoting The Montreal Declaration that AI “must help eliminate relationships of domination between groups and people based on differences of power, wealth, or knowledge” and “must produce social and economic benefits for all by reducing social inequalities and vulnerabilities” (Université de Montréal, 2018). However, this is a standard so high that it risks being useless in practice. Discussions of power are entirely absent from OCHA’s guidance discussed above (UN OCHA, 2020). McElhinney et al. (2026, p. 7) address power more directly than the others, noting that SAFE AI’s mission is rooted in shifting “decision-making power towards people affected by crises and the local and national actors closest to them,” and that it is “designed to make that localisation and power shift practical in the AI lifecycle.” Dodgson et al. (2020, p. 3) are somewhat of an exception to this, noting that because humanitarian actors, unlike private or academic ones, are bound by the humanitarian principles, they argue that “ensuring dignity while reducing vulnerabilities should not be at the cost of rendering affected communities as ‘test beds’ or ‘testing sites’,” echoing Suge et al. (2026), and that “technologies that would never be applied, nor allowed in countries like the UK or US due to legal and regulatory barriers must not be applied for piloting capacity through humanitarian actions.”

Madianou’s concept of *technocolonialism* provides an additional conceptual layer to these frameworks, arguing that digital innovation in humanitarian contexts can reproduce and entrench colonial-era asymmetries between the Global North and the displaced populations who become the “subjects” of data extraction and experimentation (Madianou, 2019a; 2021b). Zuboff (2019) highlights this effect of extractionism and control in their work on *surveillance capitalism*, and how populations become subject to manipulation and behaviour change. This is complemented by the work of Couldry & Mejias (2020) and their focus on “data colonialism,” arguing that data has become the raw material essential for the functioning of modern capitalist societies. Muldoon & Wu (2023) situate AI in the

work of Quijano (2000) and the “coloniality of power”, showing the political power imbalances, the colonial nature of AI’s supply chain and knowledge production that favours the Global North and further marginalises the Global South.

Madianou (2019a) presents five logics, through which one can examine the use of digital technologies in humanitarian settings: i) *logic of humanitarian accountability*, ii) *logic of audit*, iii) *logic of capitalism*, iv) *logic of solutionism*, and v) *logic of securitisation*. She goes on to argue that “refugees and other humanitarian subjects are disproportionately affected by the convergence of digital developments, capitalism, and colonial legacies” and that by “reproducing the power asymmetries of humanitarianism, data and innovation practices become constitutive of humanitarian crises themselves” (Madianou, 2019a, p. 11). Beretta (2025b, p. 10) uses this lens to examine the *technocolonial* dynamics at play in a pilot programme for cash distribution in Togo, concluding that from “the case study it is not clear that AI will accelerate inequality in the humanitarian sector or dramatically amplify the effects of *technocolonialism*, but it clearly has the potential to do so. It is essential that the risks and challenges of using these powerful techniques are carefully considered before being piloted in contexts involving vulnerable populations, and that the imperative to ‘do no harm’ is upheld.”

The power asymmetries extend beyond extraction and control, but are also cemented in the nature of the technology itself and the infrastructure on which it depends. Access to State of the Art (SOTA) LLMs are hidden behind paid Application Programming Interfaces (APIs), subscription tiers, compute, connectivity, and the technical staff and time needed to build and sustain tools within organisations. LLM capabilities are also unevenly distributed across languages, with English-language models dominating the state of the art and under-representing the languages of the Global South, so that even where access is available, it is not equally useful. The digital text these models are trained on is scarce for low-resource languages and narrow in provenance where it exists — often being sourced only from religious texts or Wikipedia pages (Li et al., 2025; Penedo et al., 2025; Zamir et al., 2026). Work is being done by organisations such as Meta, Google and others to expand language capabilities of LLMs and access, but the reach is still limited (Diack et al., 2026; NLLB Team et al., 2022; Omnilingual ASR Team et al., 2025; Omnilingual MT Team et al., 2026).

An additional asymmetry, not explored in-depth in this thesis, is the environmental impact of AI and LLMs which compounds the power dynamics discussed

earlier and is a material risk on a global and societal level. The energy- and water-intensive data centres on which these AI systems depend for model training and inference, together with the rare-earth mining and e-waste the results, imposes climate and resource costs that disproportionately affect low-income, climate-vulnerable regions. These are the same communities least able to access their benefits and most exposed to the humanitarian consequences AI is often deployed to address (Jobin et al., 2019; Muldoon & Wu, 2023). Bender et al. (2021, p. 610) takes on both the rising financial and environmental costs of LLMs, noting the combined effect “doubly punishes marginalized communities that are least likely to benefit from the progress achieved by large LMs and most likely to be harmed by negative environmental consequences of its resource consumption.” These dynamics are largely missing from the humanitarian literature and guidance documents, and climate is included in none of the risks surveyed by Hagendorff (2020); Kreutzer et al. (2025) likewise find sustainability raised in only two of the 22 AI ethics guidelines surveyed. UNESCO (2022) do address the environmental aspect of AI, but from a policy perspective, directed at UN Member States, rather than a humanitarian one. These dynamics are discussed further in Chapter 5.

2.2 Conceptual Framework

The two frames of AI and data ethics aim to address overlapping concerns but from different perspectives, and neither on their own are considered sufficient as an analytical lens for this thesis, which focused on the intersection of both in the responsible use of AI in humanitarian contexts. The Fjeld et al. (2020) synthesis is broad but not grounded in humanitarian practice, and OCHA’s framework is grounded in humanitarian ethics but does not focus on AI — and both predate the ChatGPT era. This section synthesises the two into a single analytical lens that serves as the core of the analysis for this thesis.

2.2.1 A Merged Framework for Responsible Humanitarian AI

The merged framework is organised around six ethical principles, each drawn from the “normative core” identified by Fjeld et al. and paired with its closest counterpart in OCHA’s humanitarian data ethics and the underlying humanitarian principles (see Table 2). In the synthesis, *fairness* maps both to the AI theme of non-discrimination and to the humanitarian principle of impartiality, while *safety and security* maps to the humanitarian imperative to *do no harm*.

Each of the six principles addresses one or more of the failure modes discussed in Section 2.1.2. For example, *fairness* (FAIR) maps to algorithmic bias, *safety and security* (SAF) and *transparency* (TRANS) to hallucination, *privacy* (PRIV) to data sovereignty and the data a generative pipeline accumulates, and *human control* (HUM-CON) and *professional responsibility* (PROF-RES) to automation bias.

Principle	AI ethics theme (Fjeld et al., 2020)	Humanitarian data-ethics counterpart (UN OCHA, 2020)	Code
<i>privacy</i>	Privacy: consent, control over use of data, data protection	Privacy and anonymity; ownership of data and insights	PRIV
<i>fairness</i>	Fairness and non-discrimination: prevention of bias, inclusiveness	Bias and fairness; the principle of impartiality	FAIR
<i>transparency</i> (incl. accountability)	Transparency and explainability; accountability: notification, right to information, remedy	Transparency and explainability; validity of data and models	TRANS
<i>professional responsibility</i>	Professional responsibility: responsible design, long-term effects	Codes of conduct; duties of care towards staff and affected people	PROF-RES
<i>human control</i>	Human control of technology: human review of automated decisions	Human oversight and ethical deliberation; ethical audits	HUM-CON
<i>safety and security</i>	Safety and security: reliability, predictability, security by design	Potential harmfulness of humanitarian action; the <i>do no harm</i> imperative	SAF

Table 2: The merged framework for responsible humanitarian Artificial Intelligence (AI), based on Fjeld et al. (2020) and UN OCHA (2020). The code column shows the label used in the qualitative coding scheme.

Beyond the six principles above, the analysis in this thesis uses another three coding categories that are not part of the merged framework but are cross-cutting. *Technocolonialism* (TECH-C0) provides a lens for examining the power asymmetries discussed in Section 2.1.4, with Madianou (2019a)’s five logics, and the implications of those asymmetries for the responsible use of AI in humanitarian contexts. *Opportunities* (OPP0R) captures where participants see AI’s constructive potential, and informs the discussion of implications for practice; *Bridging solutions* (BRIDGE) attempts to uncover the bridging framework suggestions and ideas from the participants that responds to SQ3. These three are treated as cross-cutting themes and analytical overlays rather than principles and they are presented in Chapter 4.

Figure 1 below shows the merging of the two frameworks with the resulting analytical lens used in this thesis in the overlap.

Figure 1: Overlap of AI ethics (Fjeld et al., 2020) (left) and humanitarian data ethics (UN OCHA, 2020) (right) with the six merged principles used in this study in the middle.

2.3 Chapter Summary

The synthesised theoretical lens was grounded in real failure modes of AI and LLMs, and condensed into six core principles, with the humanitarian principles and the power-analytic lens of Madianou (2019a)’s *technocolonialism* treated as cross-cutting themes alongside *opportunities* and *bridging solutions*. Two gaps

persist through the literature: it largely predates generally available LLMs, and none compares how humanitarian practitioners and AI experts interpret these principles in practice — which Chapter 3 sets out to address.

Ethics is a process, not a destination. The real work of AI Ethics begins now: to translate and implement our lofty principles, and in doing so to begin to understand the real ethical challenges of AI.

— (Mittelstadt, 2019, p. 10)

3 Methodology

This chapter sets out how the merged framework developed in Section 2.2.1 was operationalised into an empirical study of the two groups of AI experts and humanitarian practitioners. Section 3.1 describes the mixed-methods approach, KII design, followed by the recruitment and sampling of participants, and the two data collection instruments which are both organised around the same six principles. The quantitative and qualitative analysis sections describe the framework analysis method that was applied to the interview material, the discursive salience weightings, and how the data was integrated into the core nine findings. This chapter closes with the ethical considerations of the study, the researcher’s positionality statement, and the limitations of the data which carries through into Chapter 4.

3.1 Research Design

This research employed a mixed-methods, KII approach, combining qualitative semi-structured interviews with a quantitative self-assessment to map and compare the ethical perspectives of two stakeholder groups: humanitarian practitioners supporting migrants in Colombia, and AI experts developing LLM technologies with potential humanitarian applications. The qualitative interviews form the core of the study and were analysed using framework analysis (Gale et al., 2013; Ritchie & Spencer, 2002), extended with a weighted coding scheme across the themes to allow for comparison against the quantitative data. The quantitative self-assessment provides a complementary structure that contextualises the qualitative findings rather than providing statistically significant claims.

3.2 Participant Recruitment and Sampling

Participants were recruited through snowball sampling, largely drawing on the researcher’s existing professional network from prior work with R4V/GIFMM-affiliated organisations in Colombia. The target sample of 10–14 participants (humanitarian practitioners: $6 \leq n \leq 8$; AI experts: $4 \leq n \leq 6$) was set to ensure adequate representation across both stakeholder groups while remaining manageable within the time constraints of a master’s thesis.

Most participants were recruited through email outreach ($n = 7$; see Appendix I and Appendix H), with the remainder recruited through in-person requests ($n = 2$) or private messaging ($n = 2$). Recruitment of humanitarian practitioners

proceeded more smoothly than for AI experts, with a far higher response rate and willingness to participate while most cold email outreach to AI experts went unanswered. The final sample consisted of $N = 11$ participants: $n = 7$ humanitarian practitioners from local and community-based organisations within Colombia that support migrants, and $n = 4$ AI experts. A summary of the participant sample is provided in Table 3.

Just over half of the participants ($n = 6$) were from INGOs, three were from Local Non-Governmental Organizations (LNGOs), one from a UN agency and one from a for-profit organisation that works within the humanitarian sector.

Participant ID	Interview Date	Organisation Type	Interview Method	Interview Language
EXP01	2025-10-24	INGO	Video call	English
EXP02	2026-02-24	INGO	Video call	English

HP07	2025-11-07	INGO	In person	Spanish

Table 3: Overview of study participants

3.3 Data Collection

Data were collected through researcher-led interviews conducted in person in Bogotá, Colombia and remotely via video conferencing, in either English or Spanish according to participant preference. In-person interviews were conducted during a period of fieldwork in Bogotá in October–November 2025. Interviews were audio-recorded with informed consent, transcribed through Automatic Speech Recognition (ASR) methods for analysis, and translated from Spanish to English through Machine Translation (MT) methods where needed.

3.3.1 Instruments and Procedure

Data collection used two KoboToolbox forms,⁸ both built in Microsoft Excel using the XLSForm standard⁹ and available in English and Spanish, designed to ensure consistency and comparability across participants:

- **Interviewer form:** the open-ended qualitative questions for both groups (see Table 4).
- **Participant form:** the quantitative rating questions using numeric scales (1–10) (see Table 5). A single form served both groups, with additional questions for humanitarian practitioners hidden from AI experts via form logic. A hidden URL parameter pre-filled the participant-group category, keeping group assignment invisible to the participant.

Prior to each interview, the consent form was sent and signed through DigiSigner¹⁰ (see Appendix F and Appendix G). The full questionnaires are provided in Appendix B, with questionnaire summaries in Table 4 and Table 5.

The full interview was audio-recorded separately for redundancy, and where KoboCollect¹¹ was used, audio was captured per question within the form.

⁸KoboToolbox is a free, open-source data collection platform widely used in humanitarian contexts. See <https://www.kobotoolbox.org>

⁹XLSForm is an open standard for designing forms using Microsoft Excel, compatible with KoboToolbox, Open Data Kit (ODK) and other platforms. See <https://xlsform.org>

¹⁰DigiSigner is a web-based electronic signature tool, used so that consent could be documented without requiring printing and scanning. See <https://www.digisigner.com>

¹¹KoboCollect is a mobile data collection app for KoboToolbox. See <https://www.kobotoolbox.org>

Figure 2: Interview data collection protocol.

3.3.2 Qualitative Component

The semi-structured interviews with both groups focused on identical core questions organised around the six ethical principles discussed in Section 2.2.1 from Fjeld et al. (2020) and UN OCHA (2020):

- i. *Privacy* and data protection
- ii. *Fairness*, equity and non-discrimination
- iii. *Transparency* and accountability
- iv. *Professional responsibility* and competence
- v. *Human control* and agency
- vi. *Safety and security*

Both humanitarian practitioners and AI experts answered the same core questions, and each group additionally received tailored follow-up questions relevant to its professional context, grouped as seen in Table 4.

Question Theme	Humanitarian Practitioners	AI Experts
Background & Role	Describe your current role and experience in humanitarian assistance.	Describe your role and experience in AI development or tool integration.
AI Familiarity	Describe your level of engagement with AI tools such as ChatGPT, Gemini, or Google Translate in your work.	—
Opportunities	What are the biggest opportunities for AI use in humanitarian and migration contexts?	What are the biggest opportunities for AI use, particularly LLMs, in humanitarian contexts?
Risks	What potential risks do you see when using AI tools with vulnerable populations or for your organisation?	What potential risks do you see when humanitarian organisations use these tools to serve vulnerable populations?
Responsibilities	What responsibilities do humanitarian organisations and their staff have in mitigating risks from AI use?	What responsibilities do AI developers and technology companies have in mitigating risks from AI use in humanitarian work?
Ethical Priorities	—	What ethical considerations do you prioritise when developing or implementing AI tools for organisations working with vulnerable populations?
Bridging Solutions <i>(All participants)</i>	What are the top one or two things that can be done to ensure AI is both helpful and avoids potential risks as it becomes more widely used in the humanitarian sector?	
Additional Comments <i>(All participants)</i>	Is there anything else you would like to add about working with AI tools in humanitarian contexts such as in Colombia?	

Table 4: Semi-structured qualitative interview guide

3.3.3 Quantitative Component

The participant form gathered a structured self-assessment on the same six ethical principles. All participants rated, on a scale of 1–10, the relative importance of each principle and how attentive they considered the field to be to it, attributed primary responsibility for upholding each principle, and completed a priority ranking across the principles. A further block of digital-tools questions — covering tooling, challenges, support, and coordination — was shown only to

humanitarian practitioners to contextualise the technological background of the group. A summary of the quantitative questionnaire is provided in Table 5.

Section / Theme	Question (English)	Notes
Digital Tools <i>(HP participants only)</i>	What types of digital technologies are you currently using for data collection and analysis?	select_multiple all that apply
	Does your organization have formal policies addressing AI use in humanitarian work?	select_one
	How well do these policies address working with migrants or vulnerable populations in Colombia/Latin America?	select_one conditional
	What are the most significant challenges for implementing AI ethically in migration contexts in Colombia?	select_multiple all that apply
	How familiar are you with AI initiatives being implemented by other organizations in Colombia such as the R4V/GIFMM network?	select_one
	What would be most valuable for implementing AI more responsibly?	select_multiple choose top 3
	What would improve coordination on responsible AI use among humanitarian organizations in Colombia?	select_multiple all that apply
Ethical Principles Assessment <i>(All participants)</i>	How important is this principle for AI use in humanitarian contexts?	range 1–10
	How attentive is your work/field to this principle?	range 1–10
	Who is primarily responsible for implementing this principle in humanitarian contexts?	select_one <i>Asked for each of the 6 principles below</i>
	1. Privacy Protection — Keeping personal information about vulnerable populations safe and confidential	
	2. Fairness — Ensuring AI tools treat all people equally, regardless of nationality, gender, race, background, etc.	
	3. Transparency — Being clear about how AI tools work and who is responsible for decisions	
	4. Professional Responsibility — Having the right skills and knowledge to use AI tools properly and responsibly	
	5. Human Control — Ensuring humans, not machines, make final decisions about people’s lives	
	6. Safety and Security — Protecting people from harm and ensuring AI tools don’t create new risks	
Principle Ranking <i>(All participants)</i>	Please rank these six principles in order of priority for AI use in humanitarian contexts.	rank 1 = highest

Table 5: Participant self-assessment survey

3.4 Data Analysis

3.4.1 Qualitative Analysis

The full audio recordings from the interviews were segmented with the audio software, Audacity.¹² Each question was segmented into a separate audio file, and then transcribed using open source and privacy preserving ASR methods. The Spanish-language interviews were translated into English using MT methods, with the original Spanish retained alongside the English translation for reference. Transcripts and translations were manually reviewed by the researcher for accuracy and completeness, with any errors corrected and any missing content added from the audio recordings. The final transcripts were anonymised, with all identifying information removed or redacted, and stored securely in accordance with ethical guidelines (see Section 3.5.3).

The interview transcripts were analysed using framework analysis (Gale et al., 2013; Ritchie & Spencer, 2002), a method designed for applied policy research where a defined structure guides coding while leaving room for inductive themes to emerge. The method was chosen due to its focus on leading to actionable outcomes and policy changes, rather than purely theoretical insights.

The analysis was conducted in Excel and each interview transcript was segmented into analytically meaningful chunks, each chunk assigned a code that allowed for detailed cross-referencing throughout the analysis (see EXP01-Q1-S1 as an example in Appendix D). Each segment was coded against a matrix structure containing the verbatim quote (Spanish with English translation for humanitarian practitioners and English for AI experts), the six principles, three analytical overlays (*opportunities*, *bridging solutions*, and *technocolonialism*), and a column for inductive codes. The result was one matrix covering all eleven participants with 265 coded segments. In Chapter 4 and Chapter 5, segment codes are hyperlinked to the full coding scheme in Appendix D, which provides the full set of coded segments for each participant.

The framework analysis approach of Ritchie & Spencer (2002) was extended to additionally include a salience weighting for each code: x (peripheral), xx (moderate), xxx (central), or blank (no salience in the segment) (see Appendix D). Since the number of segments per interview varied, the salience weighting was

¹²Audacity is an open-source audio editing software. See <https://www.audacityteam.org/>

normalised to a per-participant rate for each principle, and then averaged within each group so that every participant carries equal weight in their own group’s mean regardless of how much they said. This is referred to as the *discursive salience* of a principle, and is used to compare the qualitative and quantitative results in Section 4.2.5.

The resulting group rates were rescaled to a 0–10 range so that they could be read alongside the 1–10 self-assessment ratings. The denominator is the highest group rate observed across the six principles in either group, which in this study is the AI experts’ rate for *professional responsibility*; the three analytical overlays are reported on the same scale. Discursive salience is a comparative measure between principles, and between the two groups, and never interpreted as an absolute quantity that has significance in itself.

The discursive salience is a measure of “analytical attention” a principle receives rather than purely a count of mentions, therefore, allowing for a view into what each group prioritises during the discourse and what they rate as important. The normalised salience weightings, however, are not a measure of statistical significance, and the small sample size does not lead to any inferential claims about the population of humanitarian practitioners or AI experts in general — in line with the caution of Gale et al. (2013, p. 6), that “qualitative research is not designed to be representative of a wider population, but purposive to capture diversity around a phenomenon.”

3.4.2 Quantitative Analysis

Given the small sample ($N = 11$ participants: $n = 7$ humanitarian practitioners and $n = 4$ AI experts), there is no statistical significance to the quantitative results but rather they contribute to the qualitative analysis and context of the groups. All figures and summary tables were generated programmatically using Python from the exported KoboToolbox data in Excel format.

The ethical-principles block of questions was completed by all participants, therefore allowing for a comparison between groups, while the digital-tools block of questions was shown only to humanitarian practitioners and is reported as descriptive context on that sample alone (see Section 4.1).

Group means and sample standard deviations were calculated for each principle, given the 1–10 importance and field-attention ratings. The importance-minus-attention difference was used as an indication of the perceived gap between

a principle’s perceived importance and its application in the field. This further allowed for comparison with the discursive salience from the qualitative analysis, and the two were integrated in Section 4.2.5. Single-choice questions responsibility attributions per principle, and the multi-select questions for data tooling, challenges, support needs, and coordination items were summarised as respondent counts and shares.

The final question in the self-assessment, asking for a forced priority ranking of principles, was summarised using a mean Borda score. Each rank r contributes $6 - r$ points, giving a 0–5 scale, and these are averaged within group so that the ordering remains comparable across the two unequal-sized groups. A higher Borda score indicates a higher perceived priority across the group.

3.5 Ethical Considerations

This research received ethical clearance from the Network on Humanitarian Action (NOHA) Ethics Committee at the University of Groningen (RUG) prior to the commencement of data collection on 24 June 2025 (see Appendix A for ethics approval). The following section outlines the key ethical considerations addressed in the application and the procedures implemented to ensure ethical conduct throughout the study.

3.5.1 Research Design and Participant Profile

The study involved human participants, publicly available datasets, and public secondary sources. All participants were adults (18 years and older) recruited on the basis of specific professional expertise: humanitarian practitioners working directly with AI technologies or data systems in migrant assistance or related contexts in Colombia, and AI experts involved in developing or studying LLM technologies with potential humanitarian applications. Participants were not in a dependent or subordinate position to the researcher outside the context of the study, and no vulnerable populations were involved.

3.5.2 Informed Consent and Voluntary Participation

Informed consent was obtained from all participants prior to each interview, in English or Spanish depending on the participant’s preference (see Appendix F and Appendix G). The consent process clearly communicated the purpose of the research, the nature of participation (a 45–60-minute semi-structured interview followed by a brief quantitative assessment), the use of audio recording, data

handling, processing and storage procedures, anonymisation practices, and participants' rights to access, correct, or withdraw their data up to two weeks following their interview. Participants were also informed that withdrawal of consent for audio recording was possible while still participating in the study through written notes only. No compensation was provided for participation.

These rights were reiterated verbally at the start of each interview, along with an introduction to the purpose of the study, and participants were given the opportunity to ask questions before proceeding.

3.5.3 Confidentiality and Anonymisation

All research data were collected and stored in anonymised form. Audio recordings were transcribed shortly after collection and all identifying information removed or redacted, with transcripts stored using participant codes only (e.g., HP01 = humanitarian practitioner, EXP01 = AI expert). Voice recordings and consent forms containing participant names and signatures were stored separately from anonymised research data, and only the researcher is authorised to combine these files. Audio recordings were deleted six months after data collection.

Research data are stored on encrypted, password-protected devices and cloud storage with two-factor authentication, with additional backup via RUG's secure Y-drive storage system. These measures comply with the General Data Protection Regulation (GDPR) on the basis of: (1) lawful processing for legitimate research interest; (2) data minimisation; (3) purpose limitation; (4) storage limitation with a five-year retention period; and (5) appropriate security measures.

3.5.4 National Legal Compliance

Part of the research was conducted in Colombia, which does not require specific government authorisation for academic research involving interviews with professional practitioners acting in their official capacity. The study complies with Colombian data protection law, *Ley Estatutaria 1581 de 2012* (Congreso de Colombia, 2012), and applicable international ethical standards.

3.5.5 Potential Harms and Mitigation

The study was not assessed as carrying negative consequences or discomfort for participants. The focus on professional perspectives regarding ethical frameworks — rather than on institutional policies, classified content, personal experience of harm or details of any sensitive information — minimised the risk of unintended

disclosures. Any identifying information that could potentially be linked to specific organisations or individuals was redacted from the audio files and transcripts, and is not included in the analysis.

3.6 Reflexivity and Positionality

The researcher is both a humanitarian practitioner and technologist with experience working in the R4V network in Colombia (GIFMM) and Peru (Grupo de Trabajo para Refugiados y Migrantes (GTRM)) through their organisation, Kobo,¹³ and a master's student conducting this research independently as part of the Erasmus Mundus Joint Master's Degree Programme in International Humanitarian Action.¹⁴ Kobo provided support for the research, including allowing the researcher reduced working hours to conduct the research, and access to their network, but did not influence the research design, interpretation, or take part in any of the data collection, analysis or synthesis. The researcher's professional background and organisational affiliation provided access to the target participant group of humanitarian practitioners, but also required careful consideration of potential biases and power dynamics in recruitment and data collection, especially for the humanitarian practitioners in Colombia who may use KoboToolbox in their work.

The researcher took steps to ensure that participation was voluntary and that participants felt comfortable sharing their perspectives without fear of repercussions within their professional networks. The researcher ensured that no sensitive information about specific organisations or individuals was collected or disclosed, and that the focus remained on general perspectives regarding ethical principles rather than institutional policies or personal experiences.

The researcher is also a white, cisgender, heterosexual male associated with a university and INGO based in the Global North, which may have influenced the perspectives of participants, particularly those from the Global South. The researcher is from the Global South himself (Republic of South Africa), but not from Colombia, Latin America or the Latino community, and speaks Spanish

¹³Kobo is a non-profit organisation that develops and maintains the open-source KoboToolbox platform for data collection and analysis (see <https://kobo.ngo>). The researcher is affiliated with Kobo and currently holds the position of *Humanitarian Project Coordinator*.

¹⁴See <https://nohanet.org/masters>

only as a second language up to a B2.2 level,¹⁵ therefore cultural and linguistic subtleties were surely lost in the exchange. The researcher also does not have direct experience working with migrants, which may have influenced the perspectives of participants and the interpretation of results.

3.7 Limitations

Several limitations bear on the interpretation of this research’s findings:

- i. This research does not examine the technical implementation details of specific AI systems or attempt to build or test actual AI solutions. It instead focuses on the ethical frameworks that should guide implementation in humanitarian contexts.
- ii. This research does not involve direct interaction with affected populations or vulnerable groups, remaining focused on professionals in humanitarian AI development and individuals working within humanitarian organisations.
- iii. This research is limited by its focus on a specific geographic and thematic context (Colombia, migration, humanitarian assistance), which limits the generality of findings to other contexts, especially those outside of Latin America.
- iv. This research is limited in the size of the participant sample ($N = 11$: humanitarian practitioners, $n = 7$; AI experts, $n = 4$) and the profile of participants that were available for recruitment, which does not fully capture the diversity of perspectives within each stakeholder group.
- v. The sample size is not statistically significant, and the findings are interpreted with this in mind.
- vi. All of the humanitarian practitioners ($n = 7$) were based in Bogotá, which may not reflect the perspectives of practitioners working in other regions of Colombia or in other countries. Only one of the AI experts ($n = 4$) was from the Global South, therefore limiting the perspectives of developers working in non-Western contexts.
- vii. Gender diversity was limited, with only two women represented in the group of humanitarian practitioners and none in the group of AI experts.

¹⁵B2-level proficiency in Spanish is considered intermediate according to Diplomas de Español como Lengua Extranjera (DELE) and Common European Framework of Reference for Languages (CEFR). The researcher obtained a B2.2 (high intermediate level) certificate in Spanish at the University of Deusto in 2025, and previously a B2 certificate at RUG in 2024.

- Participants were also largely in the age range of 30–50 years. Both the gender and the age composition of the sample may have shaped which concerns were raised and how they were framed. Future research on this topic should recruit a wider demographic and sample size.
- viii. The research also relies on self-reported data, which may be subject to personal bias or other social and environmental factors, potentially skewing the results.

3.8 Chapter Summary

This chapter set out a mixed-methods, KII design built around the six merged principles from Section 2.2.1 and how they were applied to the semi-structured interviews for two groups: AI experts and humanitarian practitioners. The interviews were transcribed, translated from Spanish to English for humanitarian practitioners, anonymised, and analysed using the framework analysis method. The framework analysis was extended to add a discursive salience weighting across all segments so that the qualitative and quantitative results could be integrated to inform the overall findings. None of the findings that follow in Chapter 4 are statistically inferential, and the convergences and divergences are offered as patterns within this sample rather than as findings about either group more broadly.

4 Findings

This chapter presents the results and findings from both the quantitative and qualitative branches of this research, and synthesises them into a provisional bridging framework. It opens with the quantitative results from the self-assessment questionnaire (Section 4.1), which establishes how the two groups *rate* and rank the six merged ethical principles, and turns then to the qualitative framework analysis, which reads what they actually *reason about*. The qualitative findings are broken down by principle to see where convergence and divergence lie between and within the groups, and the three cross-cutting themes. Finally, the nine core findings are presented that emerge from the integration of the quantitative and qualitative findings (F1–F9), and a provisional bridging framework (see Section 4.2.6).

4.1 The Self-Assessment Questionnaire

Alongside the qualitative interviews, every participant completed a short structured questionnaire administered as part of the same mixed-methods session. As outlined in Chapter 3, the interviews began with qualitative questions, then moved to the quantitative self-assessment, then back to final qualitative questions to close. The ethical-principles section, was answered by all eleven participants and therefore can be compared across groups to observe where divergences and convergences appear. A digital-tools block of questions, was shown only to the humanitarian practitioner group to obtain a loose profile of their digital fluency. All figures report counts and group means, and since sample sizes are small, no inferential statistics are computed or implied. The findings here will be discussed in the context of the qualitative findings in Section 4.2.5 to compare the voiced versus stated salience of each principle.

4.1.1 How the Two Groups Rate the Six Ethical Principles

The ethical-principles block of questions asked each participant two 1–10 ratings for each of the six principles (see Section 3.3.3): how *important* the principle is for AI use in humanitarian contexts, and how *attentive* their own work or field currently is to it. They were additionally asked to then note who they considered most responsible for upholding each principle, presented below in Section 4.1.3. Figure 3 shows both quantities side by side for each group. Depending on the participant and the principle, some were clearer to rank than others. It was also

communicated that the ratings should not all be at the extremes, i.e. sitting at 10 or 0 for every principle.

Importance is rated high by each participant across almost every principle and the ratings per principle roughly agree between groups. The point of departure between groups is the *difference* between *importance* and *attention*, i.e. the extent to which participants judge the field to fall short of a particular principle. This gap is much tighter for practitioners than for AI experts, who almost consistently perceive a larger difference between the importance of the principles and the attention they believe the field currently gives them. Interestingly, for AI experts, *human control* is the only principle where they perceive the field to be more attentive than important.

Figure 3: Mean perceived importance of each ethical principle against the mean perceived field-attention it receives, by group (humanitarian practitioners, $n = 7$; AI experts, $n = 4$). Source: self-assessment questionnaire.

4.1.2 The Perceived Importance–Attention Gap Between Groups

Figure 4 shows the difference between importance and attention in isolation to highlight where groups agree or disagree most with how the principles are applied in practice. Table 6 gives the underlying means and standard deviations for Figure 4 and Figure 3, showing the between-group divergence for each principle in its final column.

As noted earlier, the gap is positive for almost every principle in both groups, except for *human control* for AI experts. Furthermore, the gap is consistently wider among AI experts than among practitioners for *privacy* (+3.25 vs. +0.43), *fairness*

(+3.00 vs. +0.57), *transparency* (+3.75 vs. +1.29), and *professional responsibility* (+3.75 vs. +0.71), but in the same direction: higher importance than field-attention. Only for the principle of *human control* is the direction between groups reversed, and only for *safety and security* and *human control* is the difference greater for humanitarian practitioners than AI experts, however these are also the two principles with the most agreement (smallest absolute divergence of 0.93 and 1.50).

This pattern suggests that the AI experts are more critical of the application and understanding of the principles in practice. Especially striking is that *professional responsibility* is considered the widest gap by AI experts (+3.75), yet one of the smallest gaps by practitioners (0.71), resulting in the widest between-group divergence of any principle (+3.04).

Figure 4: Perceived gap between rated importance and rated field-attention for each principle, by group. Source: self-assessment questionnaire.

Principle	Group	Importance	Field attention	Gap (imp. – att.)	Divergence (exp. – pract.)
<i>Privacy</i>	Practitioners	9.86 (0.38)	9.43 (0.79)	0.43 (0.53)	+2.82
	Experts	8.75 (1.50)	5.50 (1.73)	3.25 (1.89)	
<i>Fairness</i>	Practitioners	8.71 (1.11)	8.14 (1.21)	0.57 (2.15)	+2.43
	Experts	9.25 (0.96)	6.25 (2.06)	3.00 (2.45)	
<i>Transparency</i>	Practitioners	8.57 (1.62)	7.29 (1.80)	1.29 (1.25)	+2.46
	Experts	8.50 (2.38)	4.75 (2.06)	3.75 (2.36)	
<i>Professional responsibility</i>	Practitioners	8.00 (1.73)	7.29 (2.43)	0.71 (2.06)	+3.04
	Experts	8.75 (2.50)	5.00 (3.56)	3.75 (4.35)	
<i>Human control</i>	Practitioners	9.57 (1.13)	8.57 (2.15)	1.00 (2.52)	−1.50
	Experts	7.50 (2.38)	8.00 (1.83)	−0.50 (3.32)

	Experts	9.00 (2.00)	8.50 (1.91)	0.50 (1.00)	

Table 6: Ethical-principles ratings by group (practitioners $n = 7$, experts $n = 4$): mean (sample SD) importance and field attention on the 1–10 scale, their within-respondent gap, and divergence = expert gap – practitioner gap. Source: self-assessment questionnaire.

The standard deviations reported throughout are sample standard deviations, computed with Bessel’s correction¹⁶ as:

$$s = \sqrt{\frac{1}{N-1} \sum_{i=1}^N (x_i - \bar{x})^2} \quad (1)$$

where N is the number of respondents in the group, x_i is an individual respondent’s score, and $\bar{x}$ is the group mean for that principle.

4.1.3 Responsibility For Implementing The Principles

As noted earlier, for each principle, participants also selected who is *primarily* responsible for implementing it in humanitarian contexts: humanitarian actors, AI developers and technology companies, or government and regulatory bodies. Figure 5 shows this attribution across the two groups.

Interestingly, both groups consider that responsibility for the principle of *professional responsibility* lies almost entirely with humanitarian actors. Both groups lean towards humanitarian actors for *privacy* and *human control*. Only on the principle of *fairness* is there clear divergence, and also more disagreement between groups: humanitarian practitioners overwhelmingly place the responsibility on AI developers and technology companies, whereas the AI experts are split 50-50 between humanitarian actors and developers. *transparency* and *safety and security*

¹⁶Bessel’s correction is the use of $N - 1$ rather than N in the denominator, counteracting the downward bias that arises because deviations are measured from the sample mean rather than the unknown true mean.

are the only two principles attributed, in part, to government and regulators by both groups. Overall, there is agreement across both groups that humanitarian actors are considered to carry the primary responsibility for implementing the principles (see details in Table 15).

Figure 5: Attribution of primary responsibility for each principle, as a share of respondents within each group (humanitarian practitioners, $n = 7$; AI experts, $n = 4$). Source: self-assessment questionnaire.

4.1.4 Priority Ordering of the Principles

In the final section of the self-assessment, participants were asked to rank all six principles from 1 (highest priority) to 6 (lowest), forcing them to prioritise the principles where their earlier ratings may have clustered them close together — which, as can be seen in Figure 3, was indeed the case. The Borda method of scoring determines a weighting for each principle which is then compared in Figure 6. Every respondent’s rank $r \in \{1, \dots, 6\}$ for a principle contributes $6 - r$ points (a first-place ranking is worth 5, a last-place ranking 0), and these are averaged over the N respondents in the group:

$$B = \frac{1}{N} \sum_{j=1}^N (6 - r_j) \quad (2)$$

where r_j is respondent j ’s rank for that principle. Averaging within group keeps the resulting 0–5 scale comparable across the two groups ($n = 7$ for humanitarian practitioners and $n = 4$ for AI experts), with higher bars indicating higher priority

of the principle within the group.¹⁷

Privacy is the highest priority for practitioners (4.1) and is high for experts as well (2.0) — although is simultaneously the principle with the widest difference between the groups (difference of 2.1). AI experts have similar scoring across the principles, indicating no clear priority within the group. *Professional responsibility* ranks near the top for both (2.9 and 3.0 respectively). AI experts rank *human control* as the highest priority with *transparency* as the lowest, but there is no significant difference between the two extremes: 3.2 for *human control* vs 1.8 for *transparency*.

Figure 6: Mean Borda score of the six principles by group. Source: self-assessment questionnaire.

¹⁷As a worked example, suppose a group of five respondents ranks privacy protection 1st, 1st, 2nd, 3rd, and 5th. The per-respondent points are $6 - 1 = 5$, 5 , $6 - 2 = 4$, $6 - 3 = 3$, and $6 - 5 = 1$, summing to 16; the Borda score is then $B = 16/5 = 3.2$.

Principle	Group	Mean Borda (0–5)	Mean rank (SD)
<i>Privacy</i>	Practitioners	4.14	1.86 (0.90)
	Experts	2.00	4.00 (1.83)
<i>Fairness</i>	Practitioners	1.14	4.86 (1.21)
	Experts	2.25	3.75 (1.71)
<i>Transparency</i>	Practitioners	1.71	4.29 (1.25)
	Experts	1.75	4.25 (1.50)
<i>Professional responsibility</i>	Practitioners	2.86	3.14 (1.77)
	Experts	3.00	3.00 (2.45)
<i>Human control</i>	Practitioners	2.57	3.43 (1.62)
	Experts	3.25	2.75 (1.50)
<i>Safety and security</i>	Practitioners	2.57	3.43 (2.15)
	Experts	2.75	3.25 (2.06)

Table 7: Priority of the six principles by group (humanitarian practitioners $n = 7$, AI experts $n = 4$): mean Borda score (rank $r \rightarrow 6 - r$ points, higher = higher priority) and the equivalent mean rank (1 = highest) with sample SD. Source: self-assessment questionnaire.

4.1.5 Practitioner Context: Tools, Policies, and Coordination

An additional block of questions was given only to practitioners, and are reported here as context on the practitioner sample rather than allowing for cross-group comparisons like the other question blocks intended to do. Figure 7 summarises the digital tools that the group uses (see details in Table 16). Data collection and analysis is a common thread through the group and the tools are nearly consistent across all participants: Microsoft Forms/Excel (100%), KoboToolbox (86%), and PowerBI and Google Forms/Sheets (71%). More technical tools such as Python, SPSS, and Tableau are only used by a few.

Generally throughout the group, AI governance is minimal or completely lacking within their organisations, with only one respondent noting that their organisation has a comprehensive AI policy, while most reported no policy, a policy is planned, or that they did not know. Familiarity with AI current initiatives in the humanitarian context in Colombia was also very low, with most practitioners reporting little or no familiarity.

Figure 7: Practitioner sample only ($n = 7$): digital technologies used for data collection and analysis (top, multi-select, so counts exceed n), organisational AI-policy status (bottom left) and familiarity with peer AI initiatives such as R4V/ GIFMM (bottom right). Source: self-assessment questionnaire.

Figure 8 shows what the group of humanitarian practitioners see as the main obstacles to ethical AI use, what support they see as most valuable, and what they think would improve coordination between organisations (see details in Table 17, Appendix C). Data sovereignty was selected by all participants, followed by the availability of culturally appropriate training data. Interestingly, language barriers were only flagged by a single practitioner (although could be grouped together with the choice of culturally appropriate training data), a topic discussed further in Section 5.2.5 to put this particular issue in context.

Training and capacity building, and access to humanitarian-specific AI tools is a clear priority across the group. Responses for coordination priorities are more mixed, with no single theme dominating, although common data standards comes out marginally ahead of the other options. Surprisingly, especially given the current context and the background laid out in Chapter 1, the issue of funding was least dominant across the group for both the question on support priorities for responsible AI use, and for how to improve inter-agency coordination.

Figure 8: Practitioner sample only ($n = 7$): challenges to implementing AI ethically (left), most valuable forms of support (centre, maximum three picks) and measures that would most improve inter-agency coordination (right). All multi-select, so counts exceed n . Source: self-assessment questionnaire.

4.2 The Qualitative Interviews

The eleven semi-structured interviews were coded against the six merged ethical principles using the framework-analysis procedure described in Chapter 3. The three further codes of *opportunities* (OPP0R), *bridging solutions* (BRIDGE) and *technocolonialism* (TECH-C0) were applied to break down the analysis across these cross-cutting themes. The analysis of principles is broken down into three stages:

- i. The discursive salience each group gave to the principles (see Section 4.2.1), rated by the researcher on a scale of 0–3, allowing for comparison with the self-assessment survey data (see Section 4.1);
- ii. A breakdown of principle-by-principle between AI experts and humanitarian practitioners (see Section 4.2.2);
- iii. Emergent themes captured by the inductive codes, which recur across the qualitative data for both groups (see Section 4.2.3).

This is followed by an analysis of the three cross-cutting overlays (see Section 4.2.4). Finally, an integration of the qualitative findings with the survey data follows in (see Section 4.2.5), elaborating a list of nine core findings, and closing with a proposed bridging framework in (see Section 4.2.6). The full catalogue of coded segments is in Appendix D with identifiers in the form of HP01-Q2-S2.

4.2.1 Discursive Salience of the Six Principles

Each of the participant transcripts were broken down by question and then segmented into discrete blocks of text that were coded against the six principles and three additional cross cutting codes as noted earlier. Each segment was then

weighted by the researcher on a scale of 0–3 to indicate the degree of analytical attention given to each principle in that segment. This is referred to as the *discursive salience*: the weighted attention each principle receives per segment, averaged across a group’s participants and normalised to a 0–10 scale so that they can be compared to the quantitative figures (see Chapter 3). The number of segments per group differed noticeably, with AI experts averaging 31.5 coded segments versus 19.9 for the humanitarian practitioners. Figure 9 shows the resulting profile for each group, and Table 8 shows the figures.

Figure 9: Radar chart showing discursive salience across the six principles, by group. Source: framework-analysis coding.

Principle	HP (n=7)		EXP (n=4)	
	per segment	salience	per segment	salience
Privacy	0.47	2.3	0.46	2.2
Fairness	0.55	2.7	0.55	2.7
Transparency	0.43	2.1	0.52	2.5
Professional resp.	1.63	8.0	2.04	10.0
Human control	1.09	5.4	0.82	4.0
Safety	0.86	4.2	1.21	5.9

Table 8: Discursive salience per principle: each group’s mean weight per coded segment, and its 0–10 normalisation (ceiling = 2.0419, the largest group rate).

Source: framework-analysis coding.

Interestingly, the resulting shape of the radar chart for each group is quite similar, with *professional responsibility* taking the clear lead for both groups: maxing out at 10.0 for AI experts (and setting the ceiling for normalisation of the data) and 8.0 for humanitarian practitioners. The next most salient principles are *human control* for humanitarian practitioners (5.4 versus 4.0) and *safety and security* for AI experts (5.9 versus 4.2), showing the only clear departure between them. The remaining three principles of *privacy*, *fairness* and *transparency* trail behind but are more consistent across the groups. What separates the groups or causes convergence in this salience comparison is not the strength or correctness of their arguments, but rather the amount of attention they gave to each principle in the interview, and is therefore a proxy of what they considered most important.

4.2.2 Convergence and Divergence, Principle by Principle

The sections below break down each of the six principles and analyse the discourse between and within each group, highlighting where convergences, divergences, and omissions occur. This analysis is then drawn together with the quantitative findings in Section 4.2.5, which presents the nine core findings and the bridging framework presented later in Section 4.2.6.

4.2.2.1 Professional responsibility

Both groups agree that *professional responsibility* is the primary principle for ethical AI use with humanitarian organisations, and this is where discussions from both sides converged in their discourse and self-assessment ratings. HP05 highlights that it is a personal and organisational obligation, stating that they have “all of the responsibility” (“*toda la responsabilidad*”; HP05-Q5-S1), while EXP01 frames it wider as an institutional or sectoral issue that “can’t be done by a single agency” (EXP01-Q5-S6). There appears to be convergence on the principle itself but divergence in who is primarily responsible for its implementation. This is one of the core findings across both groups and is elaborated as finding F1 in Section 4.2.5.

Humanitarian practitioners highlight repeatedly that training and comprehensive material is currently lacking and that having or developing this is an essential component for organisations and individuals being able to use AI responsibly. HP02 wants “at least a manual with certain basic recommendations on how to use AI” and names “policies” and “good practice guidelines” as organisational commitments (HP02-Q5-S1, HP02-Q5-S6); HP04 noted that at their previous organisation “there was a manual on how to use AI,” but that at “the other organisations I have

been in, there is no manual” (HP04-Q6-S2); HP06 describes their experience of seeing existing guidelines in the organisation being adapted to include AI and expects “a security protocol for AI” to follow (HP06-Q5-S1, HP06-Q5-S2). HP03 frames the principle as “responsible pedagogy” within organisations, combined with the responsibility of individuals to review the content generated by LLMs (HP03-Q5-S1, HP03-Q5-S2, HP03-Q6-S1). They go on to add that as a practitioner, adopting AI into humanitarian workflows is becoming essential, and that “those who don’t adapt will have fewer advantages relative to other organisations: funding, showing results, or being more efficient with results” (HP03-Q5-S1).

However, EXP02, highlighting the rapidly evolving pace of AI, notes regarding documentation and regulations that “no data security, no IRB will ever catch up” (EXP02-Q5-S3), and so fostering critical thinking of the individual is essential, since ‘no textbook and no rigid IT security questionnaire can replace critical thinking of “should you do this thing you’re about to do?”’, reached “based on more... deeper thinking rather than” the fact that “my boss said it was okay” (EXP02-Q5-S4); EXP04 ranks *professional responsibility* as “kind of the top one” since, according to them, it is the precondition for individuals being able to understand and apply the other principles at all (EXP04-Q6-S1).

4.2.2.2 Fairness

The principle of *fairness* shows the greatest divergence in perspectives between the two groups. HP01 sees AI as a corrective to human bias and cronyism, considering it more neutral and objective than a person might be since it is not from within the community — it is not “the same people with the same people” (“*los... mismos con los mismos*”; HP01-Q3-S2). This is echoed by HP07 who expects that “AI will help remove biases” from participatory data collection (HP07-Q7-S1). EXP01 on the other hand, sees AI as “loaded” with bias, baked into the models and can only be mitigated, not removed completely (EXP01-Q3-S5). This is noted as one of the core findings, F2 (see Section 4.2.5).

EXP02 highlights the danger of human bias already present in humanitarian processes and that there’s no getting away from it. They note that “we were biased in our data collection, we were biased in our own way of seeing the world” and a single data point “purports to represent perhaps an entire group, an entire village” (EXP02-Q4-S2, EXP02-Q4-S3). The result being that we “may only find out after a few years” that we have “systematically served the wrong populations” (EXP02-Q6-S6). EXP04 offers their informed perspective on how to mitigate the dangers

that biased AI brings, pairing guardrails and HITL verification with incremental rollout: “Start small, you have a pilot group, you kind of test with them, then you keep expanding” (EXP04-Q3-S2). EXP03 notes similarly that we need to put the AI systems in “straightjackets” to ensure that they are “not screwing things up” (EXP03-Q6-S5).

However, *fairness* is not only seen in terms of bias, but access to the technology that might be unequally distributed. HP03 notes that in territories without connectivity “those who can advance and adopt this technology advance very quickly, while those who will be left behind will stay there,” naming Arauca and Buenaventura as the places where the national team therefore falls back on “rougher data from the field” (HP03-Q4-S3). They note later that in humanitarian response contexts, it is then that communities “lose everything — even their connection” (HP03-Q7-S1), and therefore are unable to benefit from AI to help them. HP02 adds they “have not seen anyone talking about the fact that a community over there has no access to AI,” and that, compared to the humanitarian principles, access to AI or the internet is not “even categorised yet as a first necessity” (HP02-Q8-S2).

EXP03 raises the challenge of AI systematically lacking support for minority languages noting, that for vulnerable groups, their local language “still isn’t handled well,” that AI “can do a great thing of, say, translating from English to French, but it can’t do so well to go into every local language that we’re dealing in” and that management “can handwave it” while “the reality of implementing it is much harder” (EXP03-Q7-S1, EXP03-Q7-S2).

4.2.2.3 Human control

When it comes to *human control*, there is a wide range of perspectives, however, most have a bias towards using AI when it is safe and makes sense to do so. HP01 is an outlier, noting that they do not even use AI for document review: “I trust my own judgment [...] I don’t use them as a tool to review” (“*confío en mi criterio [...] no lo uso como una herramienta para hacer revisión*”; HP01-Q2-S2). HP01 is however, the same person that highlighted AI as being less biased than humans (HP01-Q3-S2), and so not consistent in their assessment of AI’s capabilities and short-comings. EXP01 places the concern on organizational capacity to handle oversight of AI systems, noting that “the first ethical decision is do we have the people we need to make this safe? [...] do we have the subject matter expert, and do they have resources and time allocated to [...] test this sufficiently for the use case?” (EXP01-Q4-S1).

Several participants refer directly or indirectly to HITL processes being important for effectively implementing *human control* in practice. HP07 notes the importance of AI not taking away the human interface with affected communities, so it acts “exclusively in the processing of information, not in the way of collecting it, so as not to lose the human and ethical component,” with “auditing at the different processes” (HP07-Q2-S2), and states a general rule of thumb in humanitarian contexts of AI not “replacing human contact with the tools” (HP07-Q6-S2) — echoing the humanitarian principle of *humanity*. HP06 notes that AI should have a limited role in proposal writing since humanitarian practitioners “know the direct context of the territory where we are” (HP06-Q3-S1). Interestingly, the same participant stated that they would restrict AI access to specific roles rather than all staff (HP06-Q6-S2) — something not raised by others. HP05 adds to this point that the outputs of AI should be validated “with the grassroots: the social worker, the doctor, the community agent, the health agent” since the LLMs don’t know the context (HP05-Q6-S1).

The AI experts take a different perspective than the humanitarian practitioners, stressing that human oversight is not necessarily the solution to AI’s problems. EXP03 raises the point that responsibility can’t just sit with individuals, since they are already overwhelmed: “you’re overworking the human, making the human work 20 hours of the day” then “you can blame the human, but it’s like, well, yes, because we overworked them” (EXP03-Q3-S4). EXP02 suggests treating an LLM like a new hire that “reports to the human in charge,” while also conceding that because these tools are not “on payroll and on the organigram,” their output is “extremely intransparent [*sic*]” (EXP02-Q3-S4), therefore opening up accountability gaps. EXP03 suggests a common implementation in LLM workflows to improve the reliability of the output, but it removes humans further from the loop: use “a different model to do a check against” the data for PII, fact-checking or translation quality (EXP03-Q6-S2, EXP03-Q6-S4).

4.2.2.4 Transparency

AI experts highlight the black-box and the non-deterministic nature of LLMs which raises serious issues around transparency and accountability in humanitarian use. EXP02 states this directly, noting that “the biggest one is the lack of deterministic reliability [...] LLMs are still a black box,” and “very good bullshitting machines” whose output is sometimes reliable and sometimes not: “is this one of the times that it’s accurate, is it one of the times that it’s bullshitting?” makes

it very hard' (EXP02-Q3-S1). HP07 echoes this from the humanitarian practitioner side, noting that AI "cannot be like a black box where we put information in and information comes out" but a stepwise process "where each step is audited and monitored by a human being" (HP07-Q5-S2). EXP01 notes the importance of being able to "interpret what's happening in the LLM even when it's a black box" and to know which guardrails help (EXP01-Q5-S4); EXP02 adds that the domain gap between a model's training data and humanitarian text raises inaccuracy risk and that "truly risk-free LLM usage doesn't exist" (EXP02-Q3-S2, EXP02-Q3-S3).

Concerns were raised by both groups about where the data ends up and how it is used by the private companies who provide the technology and tools. HP04 noted that they do not upload databases to the LLMs because they "don't know who is behind it or how [...] they could manipulate it," concluding that "the user doesn't know what is happening behind the scenes" (HP04-Q4-S1), warning that many people treat whatever the model generates "as the absolute truth" (HP04-Q7-S1). HP02 points to the issue of governance, and that technology companies and applications "hide behind the fact that you are using this and it is your responsibility. But that is in the fine print of the contract" (HP02-Q8-S4). For applications that involve conversational agents, HP07 highlights the need for disclosure to the affected populations, that "people should know," and accepting that interaction "should be the population's decision" (HP07-Q5-S3), especially since these populations "are indeed victims of scams and fraud" (HP07-Q4-S2).

The issue of informed consent is raised by EXP03, who asks whether affected people filling in a form "understand that they're giving this information and it may... be touched by AI somehow" and whether "they have the right to remove that" (EXP03-Q7-S6). The same participant noted that at their organisation, "we're not going to release synthetic content that mimics reality," the worry being that recreating the Under-Secretary-General's voice invites the question "Okay, now we can't trust [interviewee's organization] because we don't know if something they're releasing is not real?" (EXP03-Q4-S3, EXP03-Q4-S2).

4.2.2.5 Safety and security

When it comes to the principle of *safety and security*, the two groups agree on the potential risks, and identify the affected communities within humanitarian contexts as well as broader societal impacts and labour. HP01 warns that if migrants' data "isn't properly protected [...] these people face an additional risk on top of the one they are already fleeing from" ("*no están bien custodiados [...]*")

estas personas corran un riesgo adicional al del que ya están huyendo”; HP01-Q4-S1). EXP01 stresses that one of their “biggest critiques of AI is it’s going to replace jobs” (EXP01-Q3-S3), contrasting this with the existing capacity and resource constraints within humanitarian organisations: “our data protection in the humanitarian sector is not resourced. There’s one data protection officer at the entirety of the [interviewee’s organization]” (EXP01-Q4-S6). This was a striking fact to admit as this interviewee’s organisation has significant resources compared to most INGOs, and is at the forefront of humanitarian AI tool development and thought-leadership.

The humanitarian practitioners highlighted risks that the AI experts did not: that in the context of conflict, systematic discrimination or violence towards a group, both sides will have access to the same AI tools to aid both the perpetrators and the victims. HP02 observes that “the armed group also has access to that same AI” and could learn “where the aid will be” (HP02-Q7-S1). Adding to this, HP03 notes that fabricated information, the risk of LLM hallucinations raised in Section 2.1.2, may lead migrants “even to places of danger” (HP03-Q4-S4). HP06 calls out the additional data protection risk the AI brings to vulnerable populations, noting that the tools “always have vulnerabilities — hacking, system outages, and so on. So it could fail, they could attack it” (HP06-Q6-S1).

Interestingly, none of the participants across either group raised the risk of physical harm from AI, such as autonomous weapons or lethal autonomous systems, which is a common concern in the wider public discourse. The focus was instead on data security, privacy, and the potential for misuse of information in humanitarian contexts. Additionally, the societal risks brought on by climate were not raised either, despite AI’s significant impact in this area, discussed in Section 2.1.2.

4.2.2.6 Privacy

The humanitarian practitioners seemed, in general, to have a good understanding of data protection risks and exposure of personal information to third parties and AI tools. Although, as noted earlier, since humanitarian practitioners do not have developed AI policies, the guidelines they follow are self-imposed and not necessarily consistent across the sector. HP02 does not share databases, personal data or even financial information with AI, sharing only “strategic frameworks, indicators, processes” (HP02-Q4-S1), while HP03 restricts input to “only non-identifiable information,” final summary tables rather than raw data (HP03-Q2-S5). HP06

notes that they interact with the AI in “a parallel context” rather than in detail, because the data they deal with has “cases of sexual abuse, gender-based violence, displacement, deaths, combat” and individuals’ data who were formerly associated with armed groups (HP06-Q4-S2, HP06-Q4-S1);

Humanitarian practitioners raise the opaque nature of third-party data processing, with HP03 stating that “even a question we asked about Kobo... where does this information end up?” (HP03-Q4-S1), with institutional and legal boundaries that do not seem “very clear” (HP03-Q4-S5). HP04 adds to this point, stressing that they decline when ChatGPT offers to analyse a full database, noting that they “refrain from sharing data with it because I don’t know who is behind it or how... they could manipulate it” (HP04-Q4-S1). AI experts continue on this point, with EXP03 citing a review they conducted of the major LLM providers’ terms of service. What they found was “really shocking and scary”: for an individual user “they own that — whatever you put in there. They own it in perpetuity,” so uploading “spreadsheets of sensitive information for migrants” exposes it (EXP03-Q3-S2, EXP03-Q3-S1). They later add a hypothetical but realistic example of an identity-card photograph resurfacing in a fundraising campaign — “You didn’t consent to that at all” (EXP03-Q7-S8).

EXP03 and EXP01 contrast this with the challenge of governance, noting that shadow use is growing because “people feel and find it works so well” (EXP03-Q7-S4), and “the more you add guardrails at a legal level, the more people just throw PII into ChatGPT. It just becomes the shadow use of AI that no one wants to talk about, but it’s making their lives easier so they’re going to keep doing it” (EXP01-Q9-S1).

Privacy shows itself as a moral dilemma that has to be weighed against the benefit and life-saving impact the same technology promises. EXP01 states that *privacy* is “very important,” but “it’s not more important than making people safe” (EXP01-Q8-S1). This is the sharpest case of the stated-versus-said gap the integration measures, and it is taken up as a finding in F6 and later in Section 5.2.4.

4.2.3 Inductive Themes

Alongside the deductive principle and cross-cutting theme coding, inductive codes emerged from the discourse that the original framing did not capture. Table 9 shows a summary of these codes as they emerged from both groups and tended to cluster around certain distinct themes. Tier A (the upper half of the table)

are recurring themes across both groups and Tier B (lower half of the table) are strong themes that emerged by individual participants or within their group.

Inductive code	Part.	HP	EXP
Tier A — cross-cutting (recurs across participants/groups)			
capacity_constraints	7	HP01, HP02, HP05, HP06	EXP01, EXP03, EXP04
context_mismatch	5	HP04, HP06, HP07	EXP03, EXP04
accountability_gap	4	HP03	EXP01, EXP02, EXP03
donor_driven_adoption	4	HP03, HP07	EXP01, EXP04
institutional_inertia	4	HP07	EXP02, EXP03, EXP04
data_extractivism_awareness	3	HP02, HP07	EXP03
language_barriers	2	HP06	EXP03
Tier B — distinctive (participant- or group-specific)			
governance_gap	3	—	EXP01, EXP02, EXP04

Table 9: Inductive-code landscape: codes recurring across participants (Tier A) and participant- or group-specific ones (Tier B). “Part.” = number of participants using the code. Source: framework-analysis coding.

Capacity constraints consistently emerge as the most cross-cutting theme across both groups (seven of the eleven participants), as expected given the context and problem laid out in Chapter 1, and is one of the core findings in F3. For Tier B themes, there is a clearer divide between the groups where humanitarian practitioners raise themes more directly addressing the affected communities, such as genuine consent, community agency, the psychosocial function of human contact, and the desire for humanitarian AI tools taken up in Section 4.2.4.2. The AI experts tend to raise wider, sector-level themes such as governance gap (see F7), power consolidation, and a localisation gap.

4.2.4 The Three Cross-Cutting Themes

Alongside the six principles, the coding included three additional cross-cutting themes:

- i. *Opportunities* (OPP0R): where participants see AI’s concrete potential (see Section 4.2.4.1);

- ii. *Bridging solutions* (BRIDGE): summarising key points raised across the groups that feed into the framework in Section 4.2.6 (see Section 4.2.4.2); and
- iii. *Technocolonialism* (TECH-CO), the analytical frame from Madianou (2019a) (see Section 4.2.4.3).

Unlike the six principles, these cross-cutting themes were not included in the self-assessment and therefore have no quantitative rating for comparison. They are assessed on their discursive salience alone, normalised against the same cross-group ceiling as the principles so the magnitudes are comparable (see Figure 10).

Figure 10: Discursive salience (normalised weighted coding density, 0–10) of the three analytical overlays by group. Source: framework-analysis coding.

AI experts focus more on the themes of *technocolonialism* and *bridging solutions*, whereas *opportunities* is the one dimension out of the three where the humanitarian practitioners show more attention than the AI experts. Furthermore, AI experts focus more on tools that can be built and on who holds the power to build it, whereas humanitarian practitioners focus on what the technology could do to improve their work.

Figure 11 shows these cross-cutting themes in comparison to the discursive salience of the six principles. Interestingly, humanitarian practitioner focus on *opportunities* exceeds the group’s attention to almost every principle except *professional responsibility* and *human control*. Furthermore, AI expert focus on *technocolonialism* exceeds the group’s attention to every principle except *professional responsibility*. This clearly shows the salience of, and potentially the

importance that each group places on, these cross-cutting themes as some of them are more consistently in the discourse than most of the six principles themselves.

Figure 11: Discursive salience across all nine coded dimensions. Source: framework-analysis coding.

4.2.4.1 Where Participants Located AI's Promise

The *opportunities* theme (OPP0R) had weighting in 108 of the 265 coded segments and cuts across both groups and all eleven participants. The common themes across the opportunities are listed Table 10. Many of the segments that touched on the theme of AI being an opportunity only covered it in general terms rather than specific applications — these were excluded from Table 10 which focuses on specific use-cases rather than generalities.

Voiced opportunity	Both	HP (n=7)	EXP (n=4)	Illustrative segments

Table 10: The 17 opportunity themes, ordered by combined reach. ● marks a theme raised in both groups. Source: framework-analysis coding.

Figure 12 places the two groups' coverage of each theme back-to-back, as shares of each group's participants rather than raw counts, since $n = 7$ practitioners against $n = 4$ experts makes counts incomparable.

Figure 12: Opportunities by group, ordered by combined reach. Derived from the 108 segments carrying a non-zero OPPOR weighting. Source: framework-analysis coding.

Nine of the seventeen themes were raised in both groups, and the four with the widest combined reach emerge as consistent themes in both groups:

- i. Back-office automation
- ii. Proposal and report writing
- iii. Data analysis
- iv. Strategic planning

Much of the motivation behind these opportunities seems to point to efficiency gains and alleviating capacity and resources constraints that humanitarian organisations face, allowing them to better serve their communities. EXP01 puts it as “just like doing the dumb stuff, like filling in your invoice [...] the amount of time humanitarian agencies waste on just dumb bureaucratic nonsense that could be done by an AI is huge” (EXP01-Q2-S1); HP03 expresses that reports in the field “could arrive faster and carry less time burden for them. What does that imply? That they will have more time for people and less administrative burden” (HP03-Q3-S1). This ties into F6 discussed later in Section 4.2.5.

Some opportunities carry different weight for AI experts versus humanitarian practitioners, for example, to EXP03 proposal writing is not considered “anything new or exciting” (EXP03-Q2-S3) but it is critical for HP02, whose organisation has no dedicated proposal writing team and finds out about calls “three days before those calls close” (HP02-Q3-S1).

The humanitarian practitioners raise some opportunities that the AI experts do not, and vice versa — although this does not mean that the other group disregards them, only that they were not raised during the interview. For example: HP05 uses LLMs as a critical reviewer to “ask me questions [...] what am I missing, where do you think it is not well-budgeted?” (HP05-Q3-S3), and HP07 sees AI as allowing humanitarian programmes to scale and hear the voices of the affected populations, noting that their organisation received feedback from roughly two million people, 84% of whom said “nobody listens to me” (HP07-Q3-S2).

HP02 raises the argument for AI enabling improved localisation and retention of skills, using AI to draft policies rather than “hiring an expert consultant to run the same process for them,” so that they “are not investing the resource in the consultant, we are investing the resource in the organisation’s own staff [...] the learning process is not lost, because we’re still facilitating the space” (HP02-Q3-S3, HP02-Q3-S4).

EXP01 expresses the general opportunity that using AI brings to humanitarianism: *increased capacity to reach affected populations in need* — a sentiment that is broadly seen across both groups. They note that there’s a capacity gap of more than ten fold (although this is just an indicative gap in their view, not a cited one) where “we’d have 300 staff and what we would need [...] was 35,000 staff” (EXP01-Q1-S3) and asks, despite the risks of using AI in humanitarian contexts, “isn’t inaction the biggest risk?” since “the current status quo of humanitarianism completely falls short of what our call to action is” (EXP01-Q3-S1). However, despite the general optimism that EXP01 shares, they are aware of the limitations, risks and critiques of LLMs. In building AI tools, they cite a study that reports to show “95% of AI pilots fail” and that “they’re creating a new human process and a new AI process at the same time. Just put it into the human process” (EXP01-Q2-S5)¹⁸. This ties into the Section 2.1.4 discussion and the arguments of Madianou (2021b) regarding experimentation with new technologies in humanitarian contexts.

4.2.4.2 What Participants Proposed as the Bridge

The *bridging solutions* cross-cutting theme (BRIDGE) carries weightings in 97, drawing on all eleven participants. Across the 97 segments, nineteen proposals emerge and are shown in Table 11, with each additionally tagged by “addressee,”

¹⁸EXP01 might be referring to the industry working paper (not peer reviewed) by Challapally et al. which noted the “surprising result in that 95% of organizations are getting zero return” from GenAI. (Challapally et al., 2025, p. 3)

indicating who is being asked to act. Section 4.2.6 proposes six bridging components derived from the participants’ responses.

Bridging proposal	Addressed to	Both	HP (n=7)	EXP (n=4)	Illustrative segments
Training, pedagogy and AI literacy	Humanitarian organisation	●	3	3	HP02-Q8-S6, HP03-Q6-S1, EXP02-Q5-S2, EXP03-Q1-S3

Table 11: The 19 bridging proposals, ordered by combined reach. “Addressed to” is who the proposal asks to act; ● marks one raised in both groups. Source: framework-analysis coding.

Figure 13: Bridging proposals by group, ordered by combined reach. Derived from the 97 segments carrying a non-zero BRIDGE weighting. Source: framework-analysis coding.

Thirteen of the nineteen proposals were raised in both groups, the two with the widest combined reach being training and AI literacy and humanitarian-sector-specific tooling. Humanitarian Leadership Academy & Data Friendly Space (2025) report the same finding from their survey, where AI literacy is practitioners' highest priority. The gap in AI literacy is stark in the response from HP05, who strikingly noted the following about potential AI risks for the humanitarian sector:

ES No, en el trabajo que hacemos nosotros no creo [hay riesgos]. En lo humanitario no porque digamos que los riesgos son pocos. Hay otras esferas donde sí hay más temores con la IA, pero en lo que hacemos nosotros, que es responder ante emergencias en los diferentes sectores, yo no veo que haya un riesgo muy potencial

EN In the work we do, I don't think [there are risks]. In humanitarian work, because I would say the risks are few. There are other spheres where there are more fears about AI, but in what we do — responding to emergencies in the different sectors — I don't see any very significant risk.

— HP05-Q4-S1

Generally, there is good agreement between the groups and overlap in the emergent *bridging solutions* themes. Humanitarian practitioners propose almost nothing concrete that the experts do not also reach, however, AI experts propose several that humanitarian practitioners do not: fitting tools to demand that already exists, investing in people rather than technology, and “super-users” that deeply understand both AI and humanitarian ethics with an ability to implement AI in practice (EXP01-Q6-S1).

A shared, sector-agreed ethical framework is the single most widely-raised proposal among humanitarian practitioners with almost all raising it as a bridging solution — although only one of the AI experts identified this. HP07 asks for a framework “in which the sector reaches agreement [...] where we understand those risks and understand how to mitigate them and how we all agree to work on them together” (HP07-Q6-S1), and HP05 calls for “ethical agreements” built through shared construction (HP05-Q6-S2).¹⁹

EXP01 has a more cynical take on over-emphasising frameworks rather than building solutions, noting that the sector leads “with the charter on safety in AI, not the practice. And no one does the practice until there’s the charter” (EXP01-Q5-S2), leading to a chicken-and-egg situation. They emphasise iteration over constraining progress too early, stating that “governance specifically starts with practical iteration. If you’re making a contract but you never touched any of this stuff [...] you’re not regulating anything” (EXP01-Q7-S3). EXP04 echoes a similar sentiment to EXP01, highlighting the need for iteration in AI development (EXP04-Q3-S2). This is one of the core findings in F7, and one of the bridging components in C2 (see Section 4.2.6).

Data security, access control and role restriction is raised by four of seven humanitarian practitioners compared to only one AI experts, and humanitarian practitioners also emphasise rules while AI experts talk about broader frameworks and governance. HP01 wants to know that their information sent to the AI companies “will not end up being leaked and handed over or used by third parties” (HP01-Q6-S2). EXP03 takes this further, wanting to have a contractual agreement that governs the data once it reaches a cloud provider (EXP03-Q5-S4). The humanitarian practitioner sentiment reinforces the self-assessment results, where data sovereignty was a universal concern for all humanitarian practitioners (Figure 8).

¹⁹These interviews took place before the release of the SAFE AI framework in May 2026 (see Table 3), so whether it addresses these concerns is yet to be seen (McElhinney et al., 2026).

AI experts emphasise the need for technical skills and AI literacy to become more widespread and distributed throughout the organisation, and the sector more broadly. EXP01 stresses that this is needed “so all those decisions don’t get made by a team of ten [...] so that subject matter expertise goes hand in hand with tailoring to AI” (EXP01-Q6-S1). EXP02 adds to this, noting that organisations should at least have a skilled, technical individual who must be paid accordingly so that they aren’t pushed into the private sector (EXP02-Q6-S2). However, this is somewhat at odds with the sector’s current resourcing constraints.

When it comes to sector-specific tooling, the two groups do not agree: HP04 and HP06 both discuss wanting AI tools and systems built by and for the humanitarian sector (HP04-Q6-S1, HP06-Q7-S2), while EXP04 dismisses the “dream of having an LLM trained for the humanitarian sector,” based in Switzerland as some neutral tool, highlighting that the sector cannot match the capital investment needed to build and sustain these tools (EXP04-Q6-S3). EXP03 agrees with this sentiment, noting that there is “never the money” to build and maintain something sector-specific, so the best we can do is put “straightjackets” around the LLMs to constrain them (EXP03-Q6-S5). What humanitarian practitioners propose as a solution, AI experts seem to have already tried or thought about, and rejected as infeasible. This is discussed later in Section 5.2.5 and Section 5.2.6 for potential positive developments to this issue beyond what the AI experts concede as currently feasible.

Figure 14: Where each group aims its bridging proposals. Source: framework-analysis coding.

Beyond specific solutions or applications, it is interesting to look at *where* the responsibility for each proposal is directed to, tying into SQ3 of this research (discussed later in Section 5.1). Overwhelmingly, the proposals point towards

humanitarian organisations as the one responsible, also agreeing with the self-assessment data reported in Section 4.1.3 (see Figure 5). 66% of the AI experts’ bridging discourse and 57% of the humanitarian practitioners’ was addressed to humanitarian organisations, compared to 20% and 32% to those who build the tools, and 21% and 27% for the sector as a whole. Interestingly, unlike the self-assessment, government regulation or enforcement was not a theme raised in the discourse regarding responsibility in the bridging solutions.

Despite the positive and constructive nature of some of the proposals, EXP02 tempers the mood by asking “how do we get there and what do we need to do,” because “how to make actual changes within any organization [...] this is really, really hard” (EXP02-Q7-S1). They are concerned with the current state of progress in the sector, asking, “what are we concretely changing in our day-to-day? I’m not seeing enough action there [...] I have not seen any organization really be good on this front” (EXP02-Q7-S1 EXP02-Q7-S2). To round this off, EXP02 raises a sharp recommendation of restraint for both humanitarian organisations and the sector, that if a risk cannot reasonably be mitigated, “then we shouldn’t build the feature,” and being able to “vibe code something quickly and [...] solving a problem at hand doesn’t mean you should do it” (EXP02-Q4-S5, EXP02-Q5-S1).²⁰

4.2.4.3 Where Participants Located the Asymmetries

The *technocolonialism* cross-cutting theme (TECH-C0) is the most pervasive of the three themes, touching on 169 of the 265 segments and, like the other two, drawing on all eleven participants across both groups. Eighteen themes emerge from the *technocolonialism* overlay in Table 12, fourteen raised in both groups. Each of these emergent themes is further tagged with one of Madianou’s five logics it touches on (see Section 2.1.4): *logic of capitalism*, *logic of solutionism*, *logic of humanitarian accountability*, *logic of audit*, and *logic of securitisation*.

Asymmetry named	Technocolonial logic	Both	HP (n=7)	EXP (n=4)	Illustrative segments
Resourcing asymmetry as the precondition	Capitalism	●	5	4	HP01-Q7-S2, HP02-Q3-S1, EXP04-Q5-S2, EXP01-Q1-S2

²⁰“Vibe coding” describes building software by prompting an LLM in natural language and accepting the code it produces without necessarily reading or fully understanding it. The term was coined by Andrej Karpathy in early 2025, a leading AI researcher.

Asymmetry named	Technocolonial logic	Both	HP (n=7)	EXP (n=4)	Illustrative segments

Consolidation of decision-making power	Humanitarian accountability	○	—	1	EXP01-Q4-S7, EXP01-Q4-S8

Table 12: The 18 power asymmetries, ordered by combined reach and tagged by the (Madianou, 2019a) logic each engages. Italics: Artificial Intelligence (AI) voiced as *contesting* the asymmetry rather than reproducing it; ● marks a theme raised in both groups. Source: framework-analysis coding.

Figure 15: Themes of technocolonialism emerging from the 169 segments carrying a non-zero TECH-CO weighting. Source: framework-analysis coding.

The three widest-reaching themes are common across both groups and well represented in the discourse:

- Resourcing asymmetry (nine of eleven participants)
- Extraction of and sovereignty over beneficiary data (nine of eleven participants)
- Context and language written excluded from LLMs (eight of eleven participants)

On the *logic of capitalism*, HP07 highlights that we need to develop protocols and processes so that vulnerable populations “would not feel that we were extracting their culture, their information for technological processes” (HP07-Q4-S4) — a critical issue of what informed consent looks like in the AI age. EXP03 raises a similar concern but through the lens of government coercion of third-party data processors and AI providers to hand over data without consent of the humanitarian organisations or communities, something that they admit being protected from to due to “UN privileges and immunities” (EXP03-Q5-S4).²¹ EXP03 later raises the trade-off of time saved and urgency of need, noting that “it’s one thing if I sit here with Gemini on a weekend and put some stuff into it [...] It’s another if your information and your details get put into Gemini because you were starving and

²¹The immunities established under Article 105 of the UN Charter. See <https://www.un.org/en/about-us/un-charter/chapter-16>

you came somewhere to get some kind of food aid” (EXP03-Q7-S7).²² This cuts into the *logic of solutionism*, tying into F6 and the discussion of trade-offs between privacy and life-saving impact in Section 5.2.4.

Most of the *technocolonialism* themes were raised by both groups, but two are starkly raised by one and not the other. Continuing in the *logic of capitalism*, humanitarian practitioners dwell on the issue of uneven access to AI, with HP02 noting that nobody is discussing the fact that “a community over there has no access to AI” (HP02-Q8-S2). HP03 adds to the urgency of this issue in noting that “those who can advance and adopt this technology advance very quickly, while those who will be left behind will stay there” (HP03-Q4-S3), therefore potentially accelerating the digital divide and reinforcing the status quo of inequity — something Beretta (2025b) investigated recently, similarly through the lens of *technocolonialism*.

AI experts were the only group to discuss the issue of experimentation, overwhelmingly so, fitting into the *logic of solutionism*. However, EXP01 does not condemn the practice, but rather suggests at least ensuring the populations or individuals involved are sufficiently informed, stating that “it’s about setting expectations if you are experimenting or trying to test things... you’re informing people and you’re talking to people about the rights” (EXP01-Q4-S4). EXP02 addresses this directly, citing the danger of the unknown risks we are creating with these new tools and processes:

“we are introducing a whole slew of new risks that have never been seen in the world, that never been documented and we may only find out after a few years just how much harm have we done because maybe we’ve systematically served the wrong populations or introduced massive biases in a country where a whole population group has been—has been harmed and because we did not support them with aid programs when we should have and we trusted an algorithm that that told us to de-prioritize them.”

— EXP02-Q6-S6

Both groups touched on all five logics throughout the discourse, but not evenly across them, seen in Figure 16. The *logic of capitalism* clearly dominates across

²²Gemini is one of the leading LLMs, provided by Google (see <https://gemini.google.com>).

both groups, more so for humanitarian practitioners (50%) than AI experts (36%). Resource asymmetry, extraction, and dependency were common to both groups, whereas uneven access, and strengthened localisation (reversing asymmetries of power) were raised only by humanitarian practitioners. For the *logic of humanitarian accountability* (24% versus 21%) and the *logic of audit* (20% versus 14%), AI experts slightly outweigh humanitarian practitioners.

The *logic of solutionism* is almost equally raised on both sides (26% and 27%), but the focus of each group is different, where HP05 speaks for the group of humanitarian practitioners, noting the inevitability of AI use, somewhat pessimistically, noting that they “cannot refuse” to use AI tools, and that it “is inevitable, it is necessary because it is a tool that optimises processes, facilitates certain tasks, so refusing doesn’t make sense” (HP05-Q7-S1). AI experts see AI more as an opportunity and general good that can and *should* be used despite the risks. Again, this is taken up in F6 and Section 5.2.4.

Only the *logic of securitisation* is thin compared to the other logics, but both groups converge on a similar concern around the danger of data leaking or being used against vulnerable populations by bad actors using the same AI tools. HP02 addresses this directly in the context of Colombia, noting that “the armed group also has access to that same AI, they can consult it and know where the aid will be” (HP02-Q7-S1). EXP03 highlights the same concern but from the perspective of the AI providers and government influence, noting that “given [...] everything that’s going on with Anthropic and OpenAI and the Department of Defense in the US now, I imagine one could sort of speculate some kind of similar things should be discussed around the humanitarian side” (EXP03-Q5-S2).

Figure 16: Distribution of the discourse segments over Madianou’s five logics of technocolonialism. Source: framework-analysis coding.

An interesting departure or critique of the lens of *technocolonialism* in this analysis is that both groups also see AI as having the potential to democratise advanced workflows, data analysis and organisational capacity, rather than only as a tool of extraction and dependency. HP02 highlights this in stating that, “yes, but I am a local organisation with these characteristics, this function, this capacity” (“*claro pero yo soy una organización local con estas características, con esta función, con esta capacidad*”), but with them using AI, they can tell a partner “you are not going to demand this, this, and this from me” (“*mira es que no, a tu a mí no me vas a exigir esto, esto y esto*”; HP02-Q2-S3). They note that this has strengthened their organisation, and that it has “positioned us today as an anchor organisation in humanitarian matters” (“*nos ha hoy posicionado como una organización ancla en temas humanitarios*”; HP02-Q2-S4). EXP04 echoes this in noting that in the AI tooling that they are developing and offering to the sector, they “are using AI to democratize the access to data for humanitarian practitioners” (EXP04-Q1-S2). This point is taken up as F9.

HP07 adds that they can continue democratising access beyond their local organisation directly to the community, highlighting that they can produce materials and methodologies “simple enough that we could hand it over to the population itself so they could apply it and be agents of their own change” (HP07-Q7-S1). They go on to express the disruption that this will have with existing dynamics between organisations and communities, noting that “the problem is not going to be that the populations do it, manage it,” but rather that “humanitarian organisations are not ready” for this shift, and “will not use the information as we should” (HP07-Q7-S2). This is taken up later in Section 5.2.6.

The *logic of humanitarian accountability* is strongly taken up by the AI experts, highlighting the lack of accountability and misaligned incentives that exists in the current power asymmetries between the humanitarian sector and the AI providers. EXP01 asks, “what obligations do Google and Microsoft and OpenAI and Anthropic have to us?” which is met by an organisation of a couple of thousand people (EXP01-Q5-S3). EXP03 adds that the sector is in a weak position to push for change since “the billions and billions of dollars that the Department of Defense have has a lot more influence than what the humanitarian sector ever will have on them” (EXP03-Q5-S2).

4.2.5 Integration: Voiced Salience against Stated Importance

The value of the mixed-methods approach in this study lies in comparing the two quantitative and qualitative findings against each other so that we can see what participants *rate* as important in the self-assessment versus what they actually *dwell on* in the interview (discursive salience). This can be seen as a rough proxy for whether they *walk the talk*, and shows additional convergences and divergences between and inside the groups. In Figure 17, both groups are visualised side by side as an extension of Figure 3, with normalised discursive salience overlaid as a diamond.

Figure 17: Stated importance and field attention (survey means, 1–10) against discursive salience (normalised weighted coding density, 0–10), by group. Sources: self-assessment questionnaire and framework-analysis coding.

There is a near consistent and striking pattern across both groups in that the discursive salience of the principles is highly divergent from the rated importance and field attention in the self-assessment. Only *professional responsibility* sits anywhere near the rated importance values, with humanitarian practitioners having the same importance rating and salience score of 8.0, while AI experts have a slightly higher salience than importance score. *Human control* and *safety and security* sit between the two extremes, somewhere in the middle for both groups. *Privacy* shows the largest contrast, with the humanitarian practitioners' highest-rated principle at 9.9 being among their lowest salience score of 2.3. This suggests that the principles participants most readily *endorse* are often not the ones they

most *reason about* when discussing their actual practice — although this outcome could have been skewed by the qualitative questions themselves.

The radar chart in Figure 18 shows the same data in a different way, making the divergence appear more pronounced, while also showing the common pattern across both groups. It is important to remember, however, that the discursive salience only measures how much attention a topic received during the interview, and the weightings were determined by a single researcher, not what was actually said about it, which was presented earlier in the chapter.

Figure 18: Stated importance against normalised discursive salience across the six principles, per group. Sources: self-assessment questionnaire and framework-analysis coding.

Reading the quantitative and qualitative analysis together reveals nine integration findings below, F1–F9. The findings attempt to encapsulate the core themes throughout the discourse and self-assessment, including the cross-cutting themes and additional emergent themes.

F1 - Responsibility is on the humanitarians

Professional responsibility is the one principle where the discursive salience matches the self-assessment rating instead of falling far below it like the others (see Figure 18). Both groups indicate that the primary responsibility of this principle sits with the humanitarian organisations themselves, while often meaning different things by what the principle looks like in practice (see Section 4.2.2.1). HP05 localises it by noting that “we are with the people” (HP05-Q5-S1), but EXP01 sees it as shared across the sector: “can’t be done by a single agency” (EXP01-Q5-

56). Despite agreement on the importance and attribution, neither group provides a clear path forward that would result in common ground to resolve the gap, although capacity strengthening and practical guidelines are strong candidates.

See: HP05-Q5-S1, EXP01-Q5-S6, HP03-Q7-S4, EXP03-Q5-S1, HP01-Q5-S1, EXP03-Q5-S3, EXP01-Q5-S1, HP03-Q5-S1, EXP02-Q5-S4, HP05-Q5-S2

F2 - Opposing views on fairness

Fairness is the one principle where the two groups appear to disagree the most despite the discursive salience between them being identical (see Table 8). They hold opposing opinions regarding AI biases with HP01 seeing AI as a solution to human biases and EXP01 seeing it as “loaded with bias” (see Section 4.2.2.2). The importance-to-attention gap is negligible for practitioners and among the widest for experts (see Table 6 and Figure 17), suggesting that humanitarian practitioners do not perceive the same issues that AI experts do.

See: HP01-Q3-S2, EXP01-Q3-S5, HP03-Q4-S3, HP07-Q4-S3, HP07-Q7-S1, EXP02-Q6-S6, EXP02-Q4-S2, HP05-Q4-S1, HP02-Q8-S2, EXP03-Q7-S1

F3 - Capacity is a consistent limitation

Capacity constraints is the most cross-cutting inductive code across both groups, and almost consistently across all participants within the groups (see Table 9). There is a common feeling that the sector does not hold the staff, expertise, funding or governance infrastructure to effectively operationalise responsible AI in practice. The AI experts consistently name this limitation throughout the discourse and is the likely cause of the wide importance-to-attention gap for *privacy*, *fairness*, *transparency* and *professional responsibility* (see Figure 4 and Figure 17). EXP04 sums this up, stressing that both capacity and training are prerequisites to responsibly applying any of the principles for AI use (EXP04-Q6-S1).

See: EXP01-Q4-S6, HP02-Q8-S6, EXP04-Q6-S1, EXP01-Q1-S3, EXP02-Q3-S3, EXP02-Q6-S3, EXP03-Q6-S5, EXP04-Q5-S2, HP02-Q5-S1, HP06-Q7-S1, HP01-Q7-S2

F4 - Human control is viewed differently

Human control is the principle on which the humanitarian practitioners’ rating most exceeds the AI experts’, and the principle where the AI experts, marginally, see the field attention as higher than its importance (see Table 6). The discourse of the two groups shows that they understand or define this issue differently (see Section 4.2.2.3): for HP01 control is self-confidence: “I trust my own judgment” (“*confío en mi criterio*”; HP01-Q2-S2). However, for EXP01 and EXP03 capacity is the foundation: “do we have the people we need to make this safe” (EXP01-Q4-

S1), and “you can blame the human, but [...] we overworked them” (EXP03-Q3-S4). Practitioners feel that they can trust themselves to remain in control, whereas experts feel that the sector does not have the capacity to ensure that effective control is practiced, consistent with F3.

See: HP01-Q2-S2, EXP01-Q4-S1, HP04-Q5-S1, EXP03-Q3-S4, HP06-Q3-S1, HP04-Q5-S2, HP02-Q8-S5, EXP02-Q3-S4, EXP02-Q3-S3, EXP03-Q6-S4

F5 - Transparency is a common concern

Transparency is rated highly by both groups in the self-assessment and yet is the least raised in the discourse (see Figure 18). Furthermore, it shows one of the study’s widest salience-to-rating gaps, and one of the widest importance-minus-attention gaps. However, both groups discuss similar or complementary concerns of consent, data processing, accountability and opacity in the AI outputs. Both groups agree that there is an issue of LLMs being a black-box, with EXP02 noting the “lack of deterministic reliability” in models that remain “very good bullshitting machines” (EXP02-Q3-S1).

See: HP06-Q7-S3, EXP02-Q3-S1, HP07-Q5-S3, EXP03-Q7-S6, EXP02-Q3-S2, HP07-Q5-S2, HP07-Q4-S2, HP04-Q4-S1, HP02-Q8-S4

F6 - Privacy as a moral trade-off

Privacy is the humanitarian practitioners’ highest-rated principle and their clear first priority in the forced ranking from the self-assessment (see Table 6 and Table 7), however, it is one of the principles with the lowest salience in the discourse on both sides (see Table 8 and Figure 18). Humanitarian practitioners try to self-govern through intuition: HP03 inputting “only non-identifiable information” (HP03-Q2-S5), and HP06 working in “a parallel context” (HP06-Q4-S2). The AI experts see privacy as a trade-off that needs to be weighed against the potential benefits of AI use: EXP01 notes that privacy is “very important” but “not more important than making people safe” (EXP01-Q8-S1), and the practitioner weighing time saved against data protection is answering “a question no one’s equipped to answer” (EXP01-Q9-S2). EXP02 further highlights the challenge in balancing the trade-off, conceding that “as a sector we don’t know how much risk is acceptable” (EXP02-Q6-S5). Both groups seem to agree, that despite the risks, AI can be used for good in humanitarian contexts.

See: EXP01-Q8-S1, EXP01-Q9-S2, EXP02-Q6-S5, HP03-Q2-S5, HP05-Q7-S1, HP06-Q4-S2, EXP02-Q6-S7, HP02-Q4-S1, HP05-Q7-S2, EXP03-Q3-S2, EXP01-Q4-S6

F7 - AI in the shadows

The gap in effective governance is a consistent theme throughout the discourse, driving potentially dangerous behaviour and pushing practice further from transparency and accountability (see Table 9). EXP01 states the effect of bad governance strongly, that “the more you add guardrails at a legal level, the more people just throw PII into ChatGPT,” which “becomes the shadow use of AI that no one wants to talk about” (EXP01-Q9-S1), and EXP03 sees this trend only getting worse as LLMs get better (EXP03-Q7-S4). The humanitarian practitioners’ self-assessment highlights the governance gap in their organisations, with only one reporting a comprehensive AI policy (see Figure 7), but all report using AI throughout their work.

See: HP02-Q4-S5, EXP01-Q9-S1, EXP01-Q7-S3, EXP03-Q7-S4, EXP04-Q2-S1, EXP04-Q7-S1, EXP01-Q4-S3, EXP03-Q3-S1, HP06-Q5-S1, EXP01-Q5-S2

F8 - Humanitarian organisations on the hook

Both groups overwhelmingly directed their bridging solutions and suggested governance improvements at humanitarian organisations rather than at those who build the tools or regulate the technology — and the skew is *stronger* for AI experts than humanitarian practitioners (see Figure 14). The self-assessment and discourse largely direct responsibility in the same direction across nearly all principles for both groups (see Figure 5 and Section 4.2.4.2).

See: EXP02-Q5-S1, HP01-Q6-S2, EXP01-Q5-S6, EXP01-Q5-S1, EXP03-Q5-S3, EXP02-Q5-S2, EXP03-Q5-S1, EXP03-Q5-S4, HP04-Q6-S3, HP02-Q7-S2

F9 - Agreement on cross-cutting themes

The two overlays that were not put to the survey invert the principle-level pattern, and both do it the same way. Humanitarian practitioners spend more time on *opportunities* than the AI experts but many of the opportunity themes and concrete examples are shared across both groups (see Section 4.2.4.1). The AI experts discussed *technocolonialism* more than the humanitarian practitioners (see Figure 11), but similarly to *opportunities*, many of the themes were consistent or complementary across both groups (see Section 4.2.4.3). This suggests both groups have a good grasp on the dynamics of power and potential of AI when used in humanitarian contexts. Where the groups diverge in some cases is in the direction of power, with EXP01 naming “the biggest risk is consolidation of power” in the hands of technologists who are not subject-matter experts (EXP01-Q4-S7), while HP02 describes being empowered by AI to tell a partner “you are not going to demand this, this, and this from me” (HP02-Q2-S3). This is in contrast

to the dynamics of *technocolonialism* where power is now being localised through democratisation of AI.

See: EXP01-Q4-S7, EXP03-Q7-S7, HP02-Q8-S2, HP02-Q2-S3, HP03-Q3-S1, EXP04-Q1-S2, HP02-Q3-S1, HP07-Q7-S1, HP03-Q2-S4, EXP03-Q5-S4, HP02-Q5-S4, EXP04-Q4-S5

4.2.6 Towards a Bridging Framework

Addressing S03, which asked what practical frameworks could bridge the two groups’ perspectives, the analysis in this chapter provides a path towards components of a bridging framework rather than a complete and comprehensive one. Each of the six components below attempts to address the synthesis in this chapter and the core nine findings. Further work is required to develop them into a framework that addresses both groups more completely, and integrates recent work from McElhinney et al. (2026), Mandefro (2026) and others.

C1 - Proportionate risk assessment

Risks should be thoroughly assessed relative to the context of use, and mitigating safeguards put in place proportionate with the risk and potential for harm. This speaks to finding F6 where the benefits AI offers must be weighed against the potential harms. Risk analyses and impact assessments provide a way to operationalise the humanitarian obligation to *do no harm*, while always allowing the possibility that an AI tool should not be built, deployed or used at all (Beduschi, 2022; McElhinney et al., 2026).

C2 - Iterative governance

Governance is essential but can emerge and iterate alongside risk-assessed practice (see C1) rather than precede it as abstract, burdensome compliance, which drives AI use into the shadows (see F7).

C3 - Engagement with affected communities

Affected communities must be included in the design of governance structures and have a voice in setting the terms of AI use that will affect them, addressing the findings F5 and F2, and aligning with the “community in the loop” pillar built into the SAFE AI Framework (McElhinney et al., 2026; Suge et al., 2026).

C4 - Capacity building

Build human capacity and literacy ahead of mere compliance, distributed as EXP01’s embedded “super-users” rather than concentrated in a central technical team or individuals within the organisation (EXP01-Q6-S1), addressing finding F3.

C5 - Explicit chain of accountability

Document the chain of accountability: who authorises deployment, who monitors outputs, who can suspend use, who is the contact point for affected people, what external oversight applies, and what the technical specifications of the solution are (model, benchmarking results, data provenance, etc.). This addresses findings F1, F5 and F4, and aligns with the Transparency Card of the SAFE AI Framework (McElhinney et al., 2026).

C6 - Sovereignty and control

Tools must guarantee data security and have limits on downstream use and model training before they are adopted. This is named unanimously by the humanitarian practitioners as a challenge to ethical AI use (see Table 17) and linked to how both groups describe the direction of power (F9). This is the one component focused on the AI builders rather than those who use the tools (see direction skew in F8).

These six components provide an empirically-grounded starting point that can be read alongside emerging frameworks such as SAFE AI. Five of the components address humanitarian organisations with only one focused on builders of AI tools. This is a limitation in the data itself (see F8) and further work is required to build out a more complete and practical framework.

4.3 Chapter Summary

Integrating the quantitative and qualitative findings, the two groups converge on the principles themselves and on where responsibility lies, but diverge in how they operationalise them. All six principles are rated highly important by every participant, but the AI experts see a much greater gap between importance and actual practice than the humanitarian practitioners do, and both groups tend to place the primary responsibility on humanitarian organisations themselves. The data also show that the principles participants most readily endorse are often not the ones they reason about, most starkly for *privacy*, which was the humanitarian practitioners' highest-rated principle in the self-assessment and among their least discussed. Chapter 5 brings the findings and bridging components together with the literature to discuss what they mean for responsibly using AI in humanitarian contexts.

5 Discussion

This chapter critically analyses the integration of the qualitative and quantitative findings in Chapter 4 against the literature in Chapter 2 and research questions posed in Chapter 1. Section 5.2 then develops the implications for practice that follow, and, finally, Section 5.3 situates the proposed bridging components in Section 4.2.6 alongside recently published guidance documents.

5.1 Revisiting the Research Questions

5.1.1 Core Research Question

The core research question (RQ) asked how interpretations of ethical principles diverge between humanitarian AI developers (AI experts) and humanitarian practitioners. Both the qualitative and quantitative results show the divergence in *operationalisation* rather than in the principles themselves. Both groups rate all six principles similarly highly (see Figure 3) and agree that humanitarian actors carry the primary responsibility for upholding them and resolving the challenges (see Section 4.1.3, F1 and F8).

Where the groups diverge is in the perceived gap between importance and field attention, which is systematically wider for AI experts compared to humanitarian practitioners (see F3 and Section 5.2.8). The principle of *fairness* is where the groups diverge most, holding opposing beliefs about the direction in which AI moves fairness: humanitarian practitioners seeing AI as empowering localisation and a corrective to human bias, whereas AI experts see it as inherently “loaded” with bias that can only be mitigated but not removed (see F2). Compared to the others, *fairness* is also the one principle on which both groups tend to place primary responsibility on AI developers rather than humanitarian organisations (see Section 4.1.3, Figure 5 and Table 15).

Sharma (2024, p. 9) echoes this, tracing humanitarian disagreement about AI to “variances in experiencing and using AI” rather than to conflicting values. This suggests that there is common ground between the groups for collective understanding of responsible AI, and the gap is one of *operationalisation* and literacy rather than of principle.

5.1.2 Sub-Research Questions

Current application

SQ1 asked how humanitarian organisations in Colombia’s migration context currently apply ethical principles, and how this compares with how the developers of the tools apply them. While only one of seven humanitarian practitioners reports a comprehensive AI policy (see Table 16), the results show AI already in widespread use without the governance, oversight or training to do so responsibly and sustainably, leading to shadow use (see F7) and agreeing with the findings of Humanitarian Leadership Academy & Data Friendly Space (2025) and Madigan (2024). Furthermore, humanitarian practitioners tend to apply the principles according to personal judgement, while AI experts focus on sector-wide governance (see F1).

Both groups find common ground on the principles and understand many of AI’s shortcomings and opportunities, yet feel the integration of AI into humanitarian operations is both inevitable and necessary to meet the scale of need, and that the sector is not yet ready to do so responsibly. Fjeld et al. (2020, p. 5) argue that on its own “a set of principles is unlikely to be more than gently persuasive,” its impact depending on being embedded in a wider ecosystem of laws, regulations and “professional practices and everyday routines.” Despite what looks like progress in the right direction, this is not yet the case.

Prioritisation and understanding of the principles

SQ2 asked what differences exist in how each group prioritises and understands the six merged principles. Both groups rate every principle highly important, so the divergence lies elsewhere:

- i. The importance–attention gap, which is systematically wider for AI experts than humanitarian practitioners, and reversed only for *human control* (see Figure 4 and Table 6);
- ii. In the forced ranking, which sees the groups diverge most on *privacy* and *fairness*, showing the finding F2 (see Figure 6 and Table 7); and
- iii. Most starkly, though common to both groups rather than dividing them, in the *stated-versus-said gap* (self-assessment rating versus discursive salience) (see Section 4.2.5), where the principles participants rate the highest are often not the ones they most discuss (see Figure 18 and findings F1–F9).

This is the pattern that Jobin et al. (2019, p. 8) and Hagendorff (2020) predicted from their analysis, that there would be convergence on labels alongside “substantive divergence” in interpretation, importance and application in practice.

Practical frameworks to bridge the perspectives

SQ3, the stated aim of the thesis, asked what practical frameworks could bridge these perspectives. Section 4.2.6 suggests six interdependent components synthesised from the mixed-methods data. As the answer to the RQ above sets out, the group differences are largely in *operationalisation* of the principles rather than in the values themselves, so the components are aimed at this level. They should be considered a starting point for further research rather than a complete framework, in line with Mittelstadt (2019, p. 10) who notes that ethics is “not meant to be easy or formulaic,” but is “a process, not a destination.”

5.2 Implications for Practice

This section focuses on the potential opportunities that responsible AI offers that both groups discussed (see Section 4.2.4.1), in light of the risks and constraints that were covered in the analysis and theory Section 2.1.2. Both groups largely agree that there are significant opportunities for AI to improve humanitarian work, and their perspectives tended to group around common themes, both largely balancing the real risks, with minor exceptions, that AI poses in humanitarian contexts (see F9).

5.2.1 Over-Reliance on Flawed Automated Processes

AI is already being increasingly used at scale in humanitarian response and normal humanitarian operations. The benefit of speed is obvious in an emergency, but it risks embedding errors, hallucinations and biases at scale and without infrastructure and resources to ensure accuracy and safety for affected populations. HP03 identified this and agrees with the literature from Bender et al. (2021), Moore et al. (2025) and others on the danger that hallucination and bias can be amplified when AI is used to generate content that directly affects vulnerable populations (see Section 2.1.2):

ES [Hay riesgos] en falsear información, crear información. [...] Nosotros que hacemos como todo el seguimiento y a veces la información viene de territorio, ¿cuánta información es realmente lo que está pasando o es algo que se crea sin, digamos, sin un contexto simple? Y a nosotros eso nos genera una tarea adicional y es la verificación de esa información. Y no caer en lo mismo, entonces tomo estos datos y lo paso por una IA y entonces qué hace: una IA generando datos y analizando sus propios datos. [...] también para las personas

de los migrantes que busquen alguna información, confiar en esa información también puede ser un riesgo que los lleve a lugares de riesgo inclusive.

EN [There are risks] in falsifying information, creating information. [...] We do all the monitoring and sometimes information comes from the field — how much of it is really what is happening or is something created without, let’s say, without any real context? And that creates an additional task for us: verifying that information. And not falling into the same thing — taking that data and running it through an AI and then what does it happen? An AI generating data and analysing its own data. [...] also for migrants who search for some information, trusting that information can also be a risk that leads them even to places of danger.

— HP03-Q4-S2, HP03-Q4-S4

HP03 also identifies the downstream effect of this, especially when authoritative organisations such as OCHA produce AI-generated Situation Reports and other early awareness content in a response:²³ generated AI content being consumed in other AI processes created by other individuals and organisations, resulting in a feedback loop of potentially compounding errors — something highlighted by Digital Humanitarian Network (2023). The burden of information verification is transferred to the under-resourced, responding organisations and practitioners who are least able to absorb it, amplifying the effect of capacity constraints (see F3).

HP04 describes the challenge of oversight, HITL processes, and the resulting rubber-stamping discussed in Section 2.1.2, noting that colleagues at *other* organisations who “just set the response to automatic and don’t read” AI-drafted emails, so “incorrect information goes out” (HP04-Q5-S1), affirming the automation bias critiques of Steyvers & Kumar (2024) and Romeo & Conti (2026). This is only exacerbated by decision fatigue discussed by Li et al. (2025, p. 14). Exacerbating the issue, AI model providers such as Anthropic are moving to set the default

²³Recent examples of OCHA’s AI-generated material for emergency response can be seen at the following links for the 2026 Venezuelan Earthquakes: <https://reliefweb.int/report/venezuela-bolivarian-republic/earthquakes-venezuela-situation-report-32-07-august-2026-time-0200-pm> (7 August, 2026), and <https://reliefweb.int/report/venezuela-bolivarian-republic/terremotos-en-venezuela-report-de-situacion-31-31-de-julio-de-2026-hora-0500-pm> (31 July, 2026).

behaviour of their models to “auto” mode, allowing for them to perform long-running and complex tasks without human oversight.²⁴ Other practitioners also raised concerns, highlighting measures to address it, however, more on a level of self-control than organisational oversight (see HP07-Q2-S2, HP06-Q3-S1, HP05-Q6-S1). Due to chronic under-resourcing, the humanitarian sector is dangerously exposed to this, and EXP03’s highlights this, noting that “you can blame the human, but [...] we overworked them” (EXP03-Q3-S4). *Human control* appears to be the most fragile of the six principles in this context while also being the one which humanitarian practitioners rate furthest above the AI experts (see F4), suggesting overconfidence in a weak mechanism.

As AI seeps into an organisation’s processes and decision-making, the organisation becomes increasingly dependent on it, and changed by it. HP03 noted this, saying that “just as people modify AI, AI is modifying people” (“*así como las personas modifican la IA, la IA está modificando a las personas*”; HP03-Q6-S2), while there is agreement among many of the participants that organisational current processes are insufficient to moderate this behaviour, agreeing with the assessment of Mittelstadt (2019, p. 9), that shared “principles are not enough to guarantee trustworthy or ethical AI in the future.” This is what Villegas-Galaviz & Martin (2024, p. 1700) describe as *principlism*, which is the moral distance created by “a blind attachment to guidelines and principles.” EXP02 explicitly takes this on, stating that “no guidance, no checklist is ever going to fulfill the need for critical thinking whether something is truly safe enough” (EXP02-Q5-S2), tying into C4, F1 and the need for AI literacy discussed in Section 4.2.4.2 and Section 5.2.8, and reaffirmed independently by Humanitarian Leadership Academy & Data Friendly Space (2025).

5.2.2 Concentrated Expertise

One of the biggest challenges to responsible deployment of AI in humanitarian contexts is the overlapping competencies required to understand the humanitarian needs, build tools, deploy and maintain it. The process is also fragile, because when the individual who built a tool leaves the organisation, undocumented work leaves a knowledge gap, disrupted operations and potential exposure of sensitive data. EXP01 addressed this directly:

²⁴See <https://claude.com/blog/auto-mode-default-in-claude-code>

[T]he biggest problem I’ve seen is that a technical stakeholder is required to deploy good AI. You need a highly technical staff member who can trace from the end user all the way down to the model and beyond [...] if there’s not that person, it’s going to fail. And on the same side, if there is not the subject matter expert who knows the context like the back of their hand, has time allocated, who cares, that is not going to succeed.

— EXP01-Q3-S4

This tends to favour Madianou (2019a)’s *logic of solutionism* and *logic of capitalism*, reducing accountability and ability for recourse when things go wrong (*transparency*), and driving humanitarian organisations to increasingly rely on the private sector to fill the gap, which is a concern raised by both groups (see Section 5.2.9) and consistent in the literature that highlights misaligned incentive structures.

5.2.3 Tangible Opportunities for Responsible AI

Despite real risks identified in the literature (see Section 2.1.2) and discussed by the participants (see Section 4.2.2), there are tangible opportunities for responsible AI identified across the participant groups (see Section 4.2.4.1). Aligning with Digital Humanitarian Network (2023), the most consistent themes that emerged from both groups were lower-risk tasks such as back-office automation, proposal writing, data analysis, and strategic planning. These are still clearly exposed to the risks discussed throughout this thesis, but sit somewhat lower on the risk spectrum compared to the more sensitive tasks of direct engagement with vulnerable populations. SAFE AI’s Impact Assessment provides a potentially useful means of assessing the risk of a given task, and whether AI should be considered the right tool for the job (McElhinney et al., 2026).

Beyond specific use cases, it is the scale and reach of AI that has some of the most tangible opportunities for humanitarian organisations, and the sector more broadly, given the capacity constraints and resource limitations — a double-edged sword as shown above in Section 5.2.1. EXP01 notes that they received “thousands and thousands of incoming messages” but have two to seven staff available to answer them (EXP01-Q1-S2), a feature which HP07 agrees with and frames AI as a way to “ensure that more voices are heard” (HP07-Q3-S2).

AI is also a powerful tool for building the capacity of organisations and individuals and empowering them in tasks typically reserved for those with highly technical expertise. HP03 describes using LLMs to help them write Structured Query Language (SQL) for a monitoring platform, and observed that, in general, the “competitive advantage gap is narrowing” for those who do not have the technical credentials (HP03-Q2-S3, HP03-Q2-S4). It is this theme for humanitarian practitioners that counters Madianou (2019a)’s critique of *technocolonialism* — identifying AI as a means of enabling increased localisation (see F9).

5.2.4 Inaction as a Risk

There is genuine need for caution around the use of responsible AI for the humanitarian sector, as has been made clear in the literature (see Section 2.1.2) and in the empirical findings (see Section 4.2.2). However, EXP01 and EXP02 reframe what “responsible” means in this context, and highlight that it is not a simple black and white question of whether to act or not — the risk of inaction is significant, despite the shortcomings of AI. EXP01 highlights that humanitarian appeals of “a hundred billion dollars every year” are met with six, so the “biggest risk is the current status quo of humanitarianism completely falls short of what our call to action is,” and the question becomes: “Isn’t inaction the biggest risk?” (EXP01-Q3-S1). EXP02 agrees with this perspective and sees action as an obligation:

[I]t’s not just building a tool that avoids risks; if it has real potential and it can enable us to build better tools to increase the quality and reach of humanitarian response... then it’s also an obligation for us to build useful tools, tools that people want to use, that do the job well... Some risk needs to be accepted and we need to be transparent about what the risk is. [The humanitarian sector is] one of the few sectors where I think there’s a full responsibility to push forward with these tools because of this imperative that we need to help but we don’t have the means to do it.

— EXP02-Q4-S6, EXP02-Q6-S3

The literature is more critical than the AI experts’ position, and is far more on the side of restraint or abstention. Madianou (2019a) would consider this view to sit strongly in the camp of *technocolonialism*, and Beduschi (2022, p. 1169) concludes that organisations “should also evaluate whether AI systems should be

deployed at all in certain circumstances,” because “the fact that technology is available does not mean that it must be used.” EXP01 and EXP02 would not disagree with Beduschi here, but would caution against throwing the baby out with the bathwater as Madianou might.

Kreutzer et al. (2025) suggests a path closer to biomedical ethics, where the humanitarian obligation to *do no harm* is balanced against an obligation to serve those in need, despite the potential for harm. On a similar thread, Pizzi et al. (2020, p. 145) suggests treating international human rights law as “an essential baseline for ensuring that human interests are embedded in AI systems.” This might be where the proportionate risk assessment of C1 and iterative governance of C2 are needed so that the humanitarian sector does not freeze with indecision and risk further driving AI use into the shadows (see F7).

5.2.5 Low-Resource Languages and Under-Represented Populations

The populations most in need of assistance are often the least represented in training data, with their languages poorly supported or unsupported for tasks such as ASR, MT, Text-to-Speech (TTS), or general purpose LLM tools such as ChatGPT, amplifying the digital language divide discussed in the literature in Section 2.1.4.

The minimal training data available compounds the biases that Bender et al. (2021) and Beduschi (2022) describe for these under-represented populations, both on a linguistic and cultural level. Madianou (2019a)’s *logic of capitalism* adds a colonial layer as to why this persists with the lack of incentive to change, which Madigan (2024, p. 31) confirms this in their research, with one interviewee stating that “the business case on AI impact in the Global South is just not present yet.” There is a tension in the literature which on the one hand critiques the extractive nature of AI, while on the other hand, criticising the digital divide in access and quality. A situation where you cannot have your cake and eat it too, and the humanitarian sector is caught in the middle of this tension.

For AI to be used responsibly at scale in humanitarian contexts, as discussed in Section 5.2.3, these language barriers will need to be addressed. EXP03 directly addresses this, noting that for vulnerable groups their local language “still isn’t handled well,” and management “can handwave it” while “the reality of implementing it is much harder” (EXP03-Q7-S1, EXP03-Q7-S2). Similarly for HP06 it is the humanitarian context that is lacking in the models, stating that “almost no

AI understands” why a report must say “*niños, niñas y adolescentes*” rather than “*menores de edad*” (HP06-Q7-S3), and for HP04 it is the imported programme applied “directly as-is” without adapting to “the people’s situation” (HP04-Q7-S2). Beyond model quality and capability, HP02 is concerned about the community with “no access to AI” at all and HP03 noting that those without connectivity “will be left behind” (HP02-Q8-S2, HP03-Q4-S3). McElhinney et al. (2026, p. 80) concede the same limitation, that communities “in lower-resource languages remain structurally less protected by the safeguards built into commercial AI systems,” but they leave the extent and impact unquantified.

5.2.6 Limits of AI Democratisation

Humanitarian practitioners discussed that they feel AI is enabling increased localisation and democratisation of technology and skill that was previously gated. However, this democratisation does not automatically mean even distribution, since the most capable models best serve Global North or majority language contexts, and sit behind paid APIs and subscription tiers, while the compute, connectivity, technical staff and capacity are what humanitarian organisations, especially local ones, generally lack. HP03 stresses this point, noting that teams with connectivity and access will advance quickly while “those who will be left behind will stay there” (HP03-Q4-S3), leaving the national team working from “rougher data from the field.”

Open-weight models are a promising solution to many of these challenges, including language access and specialised capabilities, although they are not a panacea.²⁵ These models can be run locally or within an organisation’s own cloud infrastructure, allowing for sensitive beneficiary data to be processed without reaching a third-party server, addressing the concerns around data security, privacy and sovereignty. The models can also be fine-tuned on data beyond the original training set, allowing for them to extend to new languages and capabilities, and for the humanitarian sector to build its own capacity in this space, as shown with the work of Omnilingual MT Team et al. (2026) and Omnilingual ASR Team et al. (2025) at Meta. Marston et al. (2026, p. 1) benchmarked 46 models on qualitative coding tasks, and concluded that for “sensitive humanitarian data,

²⁵Open-weight refers to models that are published for download under various licences for individuals, researchers, organisations, and others to self-host.

open-weights models deployed on self-hosted infrastructure may offer a viable path for combining analytical scalability with stronger data governance.”

However, as mentioned already, open-weight models are not a panacea: running, fine-tuning and maintaining these models reintroduces the capacity constraint (see F3) and the dependence on a few technical staff discussed above — EXP04 is sceptical of this being able to work in practice at all (see EXP04-Q5-S2 and EXP04-Q6-S3). Open-weight models do not close the language gap, since fine-tuning is still required to extend coverage and the ability to do so requires extensive technical and linguistic expertise, and systematic data collection — since the data often does not exist in the first place — and curation to ensure that the fine-tuning data is representative and does not introduce new biases. They also do not address other risks such as hallucination, bias and automation bias, and the need for human oversight and critical thinking to ensure that the outputs are accurate and appropriate for the context (see Section 2.1.2).

5.2.7 Adoption Ahead of Governance

Surveying the current use of AI in the humanitarian sector is difficult since so much of it is still undocumented. Both groups in this study illustrate that there is clear adoption of AI running ahead of governance, and largely in the shadows (see F7). This is consistent with the first large-scale survey of humanitarian AI use in 2025, of 2,539 practitioners across 144 countries. The report showed “93% of respondents report using or having used AI tools, with 70% integrating them into daily or weekly workflows,” yet only “8% of respondents report AI as widely integrated in their organizations, while just 22% have formal organizational AI policies in place” (Humanitarian Leadership Academy & Data Friendly Space, 2025, p. 6).

Where there is any data of AI use by humanitarian organisations, it is self-reported, unverified, often out-of-date and lacks documentation or any means of independent evaluation. SAFE AI’s Transparency Card is a meaningful step in the right direction, but is not yet widely adopted or tested — only being released in May 2026 — and its use is voluntary (McElhinney et al., 2026). NetHope host a curated catalogue of humanitarian AI use-cases (see Appendix E), which is written by the implementing organisations rather than independently evaluated, so which projects remain active and how well they work is not known, and organisations have a strong incentive to overstate successes and under-report failures.

This sector-wide shadow use amplifies the risks discussed already (see Section 2.1.2) and affected populations are neither informed that these technologies are in use nor consulted in the design of the tools (McElhinney et al., 2026). This results in a vacuum of accountability and recourse to affected populations and agrees with the assessments of Pizzi et al. (2020) and Mittelstadt (2019) in that the principles, even when they exist, are not being operationalised in practice.

A downstream and compounding effect of this vacuum is the rapid proliferation of proof-of-concept (PoC) tools, often built by a single individual or small team, and never fully realised or maintained. EXP01 highlights this, noting that “95% of AI pilots fail, [...] they’re creating a new human process and a new AI process at the same time. Just put it into the human process” (EXP01-Q2-S5). This is in tension with the AI experts bias towards action over inaction (see Section 5.2.4 and F6).

In a rare case of self-disclosure, OCHA documented — although very light on the details — a pilot project they ran but never fully realised in a collaboration between ReliefWeb²⁶ and Dataminr’s “AI for Good” programme (see Section 5.2.9 for similar partnerships). They piloted an MT process for translating high priority documents to Arabic, Portuguese or Ukrainian, and extraction of figures from unstructured reports. The tool never reached production due to staffing issues and a “broader organizational transition,” with the extraction work leaving “harder questions about consistency and validation” unresolved (Keller, 2026).

The fact that even OCHA, collaborating with private sector experts, struggled to operationalise an AI pilot project focused on a capability that LLMs are already strong at (MT), and in well supported languages, shows the difficulty of moving from a PoC to a production-ready tool in a humanitarian context, never mind in contexts outside of the Global North, with minority languages and without the resources of a UN agency.²⁷

5.2.8 Capacity, Literacy and Evaluation

There is no established, humanitarian-specific way to test whether a model performs adequately on the tasks, languages and contexts a response actually

²⁶ReliefWeb is OCHA’s humanitarian information service. See <https://reliefweb.int>

²⁷Despite OCHA’s minimal disclosure in this instance, barely any information exists that is available to the public on their AI pilots, and technical implementation. Their AI-generated Situation Reports, discussed in Section 5.2.1, have no public implementation details available at the time of writing.

involves — SAFE AI states the same, that “there is currently no consistent method for verifying system behaviour in deployment” (McElhinney et al., 2026, p. 60). This is a critical gap for individuals and organisations deciding whether to adopt AI in general or for specific tasks, and which models perform best, whether open-weight or proprietary. Existing benchmarks say little about low-resource languages, the terminology of protection or needs assessment, or the edge cases where a confident but wrong output carries serious risk. Model benchmarking is sparse in the humanitarian literature, and even the benchmarking done by Marston et al. (2026) is limited to a specific use-case of qualitative data coding and only tested with synthetically generated, English transcripts. This suggests each new use-case requires a new benchmark — a process that is not straightforward and compounds on the existing capacity constraints of finding F3.

The capacity constraint running through the findings (see F3) is not only of staffing limitations and organisational budgets but of the literacy needed to use AI effectively and responsibly. Humanitarian practitioners need AI literacy to recognise where and when to use it safely, and the AI experts need enough humanitarian literacy to understand the consequences of failure in sensitive contexts (see F2), agreeing with the findings from Madigan (2024), and with EXP01 who emphasised, at least for the humanitarian practitioners, that AI literacy is a necessary condition for responsible AI use to have a chance of succeeding (see EXP01-Q3-S4, Section 5.2.2). McElhinney et al. (2026), Romeo & Conti (2026), Humanitarian Leadership Academy & Data Friendly Space (2025) and others, including the EU AI Act,²⁸ address the AI literacy side for humanitarians adopting AI, but there is no equivalent for humanitarian literacy for AI experts (see F1).

5.2.9 Coordination and the Private Sector

The numerous challenges discussed earlier that face responsible use of AI in humanitarian contexts are not something a single organisation can solve in isolation, and both groups see this as a common challenge that requires sector-wide coordination and shared infrastructure.

The low familiarity humanitarian practitioners reported with peer AI initiatives even within their own R4V/GIFMM network (see Figure 7), and their reported preference for common data standards, technical working groups, shared platforms, joint training and shared ethical guidelines all drew substantial support

²⁸Regulation (EU) 2024/1689. See <http://data.europa.eu/eli/reg/2024/1689/oj>

(see Figure 8). This is aligned with the findings of Sharma (2024, p. 13) who argue that rather than new AI governance structures the sector should be “leveraging existing collaboration platforms such as Technical Working Groups and Humanitarian Coordination Cluster systems,” treating AI as “a complementary tool within familiar frameworks.” Organisations such as NetHope, Humanitarian Leadership Academy (HLA) and CDAC seem to be addressing this to some degree, but there is clearly still a gap in coordination and shared infrastructure, and the sector is still largely dependent on the private sector to fill it.

With the capacity constraints humanitarian organisations face, but clear need for AI to make meaningful impact, the humanitarian sector is drawn to the private sector, and WFP’s partnership with Palantir is a concerning example.²⁹ WFP’s own framing, that “nothing stands between WFP and a hungry child,” sounds noble until seen in light of a partner whose business interests are weighted towards defence and surveillance technology.

This a clear case of Madianou (2019a)’s *logic of securitisation* and the *logic of capitalism* (see Section 2.1.4) which raises serious ethical concerns when operating within the humanitarian context with sensitive data and vulnerable populations. EXP03 is concerned about “everything that’s going on with Anthropic and OpenAI and the Department of Defense,” and that it “should be discussed around the humanitarian side.” Further highlighting the misaligned incentive structures and power asymmetries, that these private companies and government bodies have “a lot more influence than what the humanitarian sector ever will have” (EXP03-Q5-S2). EXP01 raises the same issue around the humanitarian sector’s lack of leverage to enable systemic change, asking “what obligations do Google and Microsoft and OpenAI and Anthropic have to us?” against an organisation of a couple of thousand people (EXP01-Q5-S3).

Mercy Corps have similarly partnered with the private sector on an agentic research assistant, built by Cloudera on Amazon Web Services infrastructure using Anthropic’s LLMs, resulting in a process that now rests on three private providers whose obligations and incentives are not humanitarian (Cloudera, 2026). The efficiency gains they report are published by the private partner and are unaudited with no independent verification, showing minimal transparency in their processes

²⁹See <https://www.palantir.com/impact/world-food-programme/>

— something that the SAFE AI Framework’s Transparency Card is designed to address (McElhinney et al., 2026).

5.3 Bridging Frameworks

When this research began in late 2025, there was a significant gap in guidance on how to implement ethical AI principles in humanitarian contexts under GenAI, the sector-specific frameworks that did exist having been written for the commissioned models of an earlier period (see Section 2.1.3). In recent months, these documents have started to appear on the scene, most notably the SAFE AI Framework from McElhinney et al. (2026) and, less comprehensively, NetHope’s PESTLE guide (Mandefro, 2026). Both were published after the interviews concluded so the governance vacuum both groups describe (see F7) should be seen in light of that.

The bridging components presented in Section 4.2.6 attempt to be a step in the right direction, emerging from engagement with AI experts, humanitarian practitioners and the literature towards a shared framework for responsible AI in humanitarian contexts. They intersect and complement the now published SAFE AI Framework and can be used to inform its further development, and the development of other guidance documents. As the bridging components stand, five of the six are focused on the responsibility of humanitarian organisations and only one (see C6) on those who build the tools. The asymmetry is evident in the qualitative data itself, with both groups focusing on humanitarian organisations in their bridging proposals (see Figure 14 and F8). This is a gap that needs to be addressed in future work. The SAFE AI Framework does have components addressing developers, although limited in scope, and it too needs to be tested and evaluated in practice for its efficacy.

Whatever shape a framework or set of guidance documents take, they need to consider the burden they place on the organisations expected to apply them. They must stay current, informed through community engagement, practical and accessible for both non-technical humanitarian practitioners and AI experts or risk being ignored, pushing AI use further into the shadows — a risk SAFE AI names directly in warning that policies which drive AI use “out of sight” govern it less effectively than those that make it visible and open to challenge (McElhinney et al., 2026, p. 29).

5.4 Chapter Summary

This chapter critically analysed the integrated qualitative and quantitative findings, showing that the two groups share the six merged principles as values and diverge in their *operationalisation*, which supports the stance of Mittelstadt (2019). The implications for practice that followed show that responsible AI adoption in humanitarian contexts is constrained less by the technical capabilities of the tools themselves than by adoption running ahead of governance and by organisational and individual capacity, literacy and coordination. The bridging components of Section 4.2.6 were then situated alongside the recently published SAFE AI Framework (McElhinney et al., 2026) and NetHope’s PESTLE guide (Mandefro, 2026), both of which post-date the interviews, noting that the components remain weighted towards the obligations of humanitarian organisations rather than those who build the tools. Next, Chapter 6 closes the thesis, laying out recommendations for the sector, and the contribution and the limits of this research.

6 Conclusions

This research did not ask *whether* humanitarian practitioners and the AI experts hold ethical principles, but *how* each group *operationalises* them in practice, and where they diverge. This chapter wraps up the empirical research, reiterating the answers to the research questions, and laying out the contribution this work hopes to make, its limits, and recommendations for future work.

6.1 Addressing the Research Questions

The central conclusion (RQ) is that the two groups diverge substantially, but in *operationalisation* of principles rather than in values themselves. Both groups largely understand the principles and rate them of high importance. What separates them is what each principle means in practice and how much attention it receives by the sector relative to its perceived importance. Only for the principle of *fairness* is there significant divergence in understanding, where humanitarian practitioners tend to see AI as a corrective to human bias while AI experts see it as a carrier of bias that can be mitigated but not eliminated (see F2). Both groups converge on the opportunities and risks that AI brings to humanitarian contexts, seeing its use as largely inevitable and necessary to meet the scale of need despite the presence of risk, but that the sector is potentially not yet ready to do so responsibly. Addressing the sub-questions:

SQ1 *Current application* AI use is already widespread and humanitarian practitioners apply ethical principles *informally*, through individual judgement rather in light of practically non-existent AI governance, with only one of seven humanitarian practitioners reporting a comprehensive AI policy. In contrast, AI experts locate the principles at institutional and sector level (see F1), though several are openly sceptical that formal instruments can keep pace with the technology and argue for iteration ahead of codification.

SQ2 *Prioritisation and understanding of the principles* The groups tend to converge on the importance of the principles but differ in how they are operationally applied and which are of highest priority. Within each group there is a systematic gap between the importance a principle is rated in the self-assessment and the attention it actually receives in discourse, only aligning on the principle of *professional responsibility*. The gap is widest for *privacy*, *fairness* and *transparency*, all rated highly but barely discussed, with

human control and *safety and security* falling between the two extremes (see Figure 18).

SQ3 *Practical frameworks to bridge the perspectives* The research developed six bridging components from the data (see Section 4.2.6): proportionate risk assessment, iterative governance, engagement with affected communities, capacity building, an explicit chain of accountability, and sovereignty and control over data. They provide a *direction* rather than a complete framework, and are focused largely on humanitarian organisations.

6.2 Contribution

The academic contribution of this research is to help move the study of AI ethics from the level of abstract principles to the level of *operationalisation* so that AI might be responsibly used in humanitarian contexts, taking advantage of its outsized benefits while mitigating the real risks. Prior work has found that AI ethics tends to converge on a common set of high-level values (Fjeld et al., 2020; Hagendorff, 2020; Jobin et al., 2019; Kreutzer, 2023), while simultaneously that principles alone cannot guarantee ethical practice (Mittelstadt, 2019). What this research adds is an empirical account of *where* and *how* the *operationalisation* of principles converge and diverge between those who build AI tools and those who use them in humanitarian contexts, outside of the Anglophone Global North, providing empirically grounded components for bridging the two groups.

6.3 Limitations

The findings and conclusions of this thesis need to be seen in light of the limitations in Section 3.7. The empirical sample for both groups is small, purposive and recruited through the researcher’s professional network ($N = 11$; $n = 7$ humanitarian practitioners, all Bogotá-based, $n = 4$ AI experts), so the findings should only be seen as patterns and not necessarily generalisable effects beyond this group and the Colombian context. The study did not engage affected populations directly and is bounded to one geographic and thematic context, so its intended relevance to comparable low-resource, non-Anglophone settings requires further research.

Most of the AI ethics and humanitarian-specific literature surveyed in Chapter 2 was published in the pre-ChatGPT era, therefore the findings need to be interpreted with that in mind. Moreover, the rapid pace of change in the AI development and the humanitarian sector means that the results of this thesis

will need to be revisited in the future. Finally, the researcher’s position as both a humanitarian practitioner and technologist shaped the analysis, as made explicit in Section 3.6.

6.4 Recommendations

For humanitarian organisations The findings of this research recommend treating AI adoption as a matter of *capacity before compliance* so that risks and opportunities can be carefully balanced, and ethical principles operationalised in practice for responsible AI use. LLMs present significant opportunities and challenges for humanitarian contexts, especially in low-resource, non-Anglophone settings, but the bridging components (see Section 4.2.6), SAFE AI Framework (McElhinney et al., 2026) and other emerging guidance documents can help guide responsible use. When adopting AI, organisations should be mindful of the proliferation of PoCs and the fragility they add to their processes, with over-reliance on individual “super-users” in the organisation and leaving themselves and the communities they aim to serve exposed to additional risks.

For AI developers and technology providers The data sovereignty component, C6, is one component in this study addressed to AI developers, based on the empirical data. Data security and limits on downstream use and model training were a concern for every humanitarian practitioners in the self-assessment, and common across both groups in the discourse. The other components, while largely addressed to humanitarian organisations, are also relevant to AI developers, and the emerging frameworks and guidance documents such as SAFE AI (McElhinney et al., 2026) and NetHope’s PESTLE guide (Mandefro, 2026) should be seriously considered and tested in practice. The humanitarian sector lacks sufficient tooling and LLM access to address the immense humanitarian need. Work is needed to extend model capabilities, language coverage, and evaluation to the humanitarian context, and to make the sector’s needs visible to those who build the tools (see Section 5.2.5, Section 5.2.6). Finally, it is critical that AI developers and technology providers engage with the humanitarian sector and humanitarian practitioners to understand the specific needs, constraints, and ethical considerations of humanitarian work, and to co-develop solutions, along with the affected communities, that are both effective and responsible, while mitigating

the power asymmetries and misaligned incentive structures inherent in these relationships.

For the humanitarian sector Collaboration is critical for responsible AI adoption across the sector rather than leaving organisations and individuals to continue operating in the shadows. The sector should explore creative solutions such as cost sharing, and pooling of resources and technical capacity, while reducing reliance on the private sector to fill the gaps. Humanitarian-specific benchmarks can be developed to evaluate model performance and relevance for specific tasks and contexts, and use-cases with their implementation details should be transparent and easily accessible. Finally, promising progress in sector-owned frameworks such as SAFE AI (McElhinney et al., 2026) and NetHope’s PESTLE guide (Mandefro, 2026) offer a starting for future work to build upon.

For future research

- Work on a more complete, AI developer-facing extension to the bridging components presented in Section 4.2.6 is needed.
- The bridging components themselves are a starting point rather than a finished product, and they require testing and validation beyond the scope of this study.
- The true language-coverage gap of LLM tooling requires measuring and testing beyond what existing studies have done, especially as those gaps overlap humanitarian contexts and need.
- Standards for humanitarian benchmarking and fine-tuning open-weight models for humanitarian contexts remains open and is a significant blocker to responsible AI adoption, and transparent and accountable evaluation across the sector.
- The efficacy of the SAFE AI Framework (McElhinney et al., 2026) and NetHope’s PESTLE guide (Mandefro, 2026) needs to be evaluated in practice.

6.5 Closing Remarks

With a foot in both camps as a humanitarian practitioner and technologist, the researcher has a general bias towards pragmatism, where the action to be taken is building capacity rather than waiting on comprehensive guidance and compliance for the sector — avoiding the tendency towards inaction and letting AI use drift into the shadows.

The researcher has experienced first-hand the challenges of operationalising responsible AI in humanitarian contexts, and the significant gap in capacity and literacy that exists on both sides of the divide. However, the researcher has also seen the real benefits in pace and scale that AI has the potential to bring, especially in rapidly changing emergency responses when international humanitarian action is mobilised. Comprehensive research and effective guidance are still lacking but the sector is adapting and appears to be moving in the right direction with the SAFE AI Framework and NetHope’s PESTLE guide (Mandefro, 2026; McElhinney et al., 2026). The risks of introducing AI into humanitarian contexts are high and should not be understated, brushed over or ignored. However, given the current state of the humanitarian sector and the potential AI and LLMs offer to address the scale of humanitarian need, the researcher ultimately agrees with the sentiment of EXP01 and EXP02 captured in Section 5.2.4, and would similarly ask: “Isn’t inaction the biggest risk?” (EXP01-Q3-S1).

Subject
Ethical approval for your thesis research “Responsible Humanitarian AI: Perspectives,
Humanitarian Principles and AI Ethics in Migrant Assistance in Colombia”.

Dear Joshua,

This is to confirm that the above research, which will be carried out as part of your MA degree in International Humanitarian Action, has been approved by the NOHA Ethics Committee as it meets the University of Groningen’s requirements for the ethical approval of research

It is your responsibility to ensure that:

- › The research is carried out in line with the information provided in the forms you have submitted;
- › The research is carried out in consultation with your supervisor;
- › You regularly re-consider the ethical issues that may be raised in generating and analysing your data;
- › You discuss your approach to research ethics in your MA thesis;

Please note that this letter has to be appended as an annex to your MA thesis.

Wishing you every success in your research,

On behalf of the Ethics Committee,

Dr Nadine Voelkner

B Interview Guide

B.1 Qualitative Interview Guide

Question name	English label	Spanish label
Humanitarian Practitioners (HP) — Core Questions		<i>Group: core_hp</i>
role_experience_hp	Could you briefly describe your current role and your experience working in humanitarian assistance throughout your career?	¿Podrías describir brevemente tu rol actual y tu experiencia trabajando en asistencia humanitaria a lo largo de tu carrera?
ai_engagement_hp	How would you describe your current level of engagement and familiarity with AI technologies like ChatGPT, Gemini, DeepSeek, Google Translate, or other AI tools in your work?	¿Cómo describirías tu nivel actual de compromiso y familiaridad con tecnologías de IA como ChatGPT, Gemini, DeepSeek, Google Translate, u otras herramientas de IA en tu trabajo?
ai_opportunities_hp	What do you see as the biggest opportunities for AI use in humanitarian and migration contexts?	¿Cuáles ves como las mayores oportunidades para el uso de IA en contextos humanitarios y migratorios?
ai_risks_hp	Do you see any potential risks when using these tools for vulnerable populations or to your organization?	¿Ves algún riesgo potencial al usar estas herramientas para poblaciones vulnerables o para tu organización?
humanitarian_responsibilities_hp	What responsibilities do humanitarian organizations and their staff have in mitigating the potential risks from using AI in their work?	¿Qué responsabilidades tienen las organizaciones humanitarias y tu personal para mitigar los riesgos potenciales del uso de IA en tu trabajo?
AI Experts (EXP) — Core Questions		<i>Group: core_exp</i>
role_experience_exp	Could you briefly describe your role and your experience working in AI development or developing tools which integrate AI throughout your career?	¿Podrías describir brevemente tu rol y por cuánto tiempo has estado trabajando en desarrollo de IA o desarrollando herramientas que integran IA?
ai_opportunities_exp	What do you see as the biggest opportunities for AI use, particularly LLMs, in humanitarian contexts?	¿Cuáles ves como las mayores oportunidades para el uso de IA, particularmente LLMs, en contextos humanitarios?
ai_risks_exp	Do you see any potential risks when humanitarian organizations use these tools to serve vulnerable populations?	¿Ves algún riesgo potencial cuando las organizaciones humanitarias usan estas her-

Question name	English label	Spanish label
		ramientas para servir a poblaciones vulnerables?
ethical_priorities_exp	What ethical considerations do you prioritise when developing/implementing AI tools for humanitarian organizations working with vulnerable populations?	¿Qué consideraciones éticas priorizas cuando desarrollas/implementas herramientas de IA para organizaciones humanitarias que trabajan con poblaciones vulnerables?
humanitarian_responsibilities_exp	What responsibilities do AI developers and technology companies have in mitigating the potential risks from using AI in humanitarian work?	¿Qué responsabilidades tienen los desarrolladores de software para mitigar los riesgos potenciales del uso de IA en el trabajo humanitario?
All Participants — Close-out Questions		<i>Group: close</i>
bridging_solutions	In your view, what would be the top one or two things that can be done to make sure that AI is both helpful and avoids potential risks as it becomes more widely used in the humanitarian sector?	En tu opinión, ¿cuáles serían las una o dos cosas principales que se pueden hacer para asegurar que la IA sea útil y evite riesgos potenciales a medida que se usa más ampliamente en el sector humanitario?
additional_comments	Is there anything else you would like to add about working with AI tools in humanitarian contexts such as in Colombia?	¿Hay algo más que te gustaría agregar sobre trabajar con herramientas de IA en contextos humanitarios como en Colombia?

Table 13: Interviewer survey (qualitative) — XLSForm question names and bilingual labels

B.2 Quantitative Participant Survey

Question name	English label	Spanish label
Digital Tools — HP participants only		<i>Group: digital_tools</i>
digital_technologies	What types of digital technologies are you currently using for data collection and analysis?	¿Qué tipos de tecnologías digitales usas actualmente para recolección y análisis de datos?
org_policies	Does your organization have formal policies addressing AI use in humanitarian work?	¿Tu organización tiene políticas formales que aborden el uso de IA en el trabajo humanitario?
policy_context	How well do these policies address working with migrants or vulnera-	¿Qué tan bien abordan estas políticas el trabajo con mi-

Question name	English label	Spanish label
	ble populations in Colombia/Latin America?	grantes o poblaciones vulnerables en Colombia/América Latina?
implementation_challenges	What are the most significant challenges for implementing AI ethically in migration contexts in Colombia?	¿Cuáles son los desafíos más significativos para implementar IA éticamente en contextos migratorios en Colombia?
ai_initiatives_familiarity	How familiar are you with AI initiatives being implemented by other organizations in Colombia such as the R4V/GIFMM network?	¿Qué tan familiarizado estás con las iniciativas de IA implementadas por otras organizaciones en Colombia como la red R4V/GIFMM?
valuable_support	What would be most valuable for implementing AI more responsibly?	¿Qué sería más valioso para implementar IA de manera más responsable?
coordination_improvements	What would improve coordination on responsible AI use among humanitarian organizations in Colombia?	¿Qué mejoraría la coordinación sobre el uso responsable de IA entre organizaciones humanitarias en Colombia?
Ethical Principles Assessment — All participants		
<i>Group: ethical_assessment. Each block below is repeated for all 6 principles.</i>		
1. Privacy Protection — <i>Keeping personal information about vulnerable populations safe and confidential</i>		
privacy_importance	How important is this principle for AI use in humanitarian contexts?	¿Qué tan importante es este principio para el uso de IA en contextos humanitarios?
privacy_attention	How attentive is your work/field to this principle?	¿Qué tan atento es tu trabajo/campo a este principio?
privacy_responsibility	Who is primarily responsible for implementing this principle in humanitarian contexts?	¿Quién es el principal responsable de implementar este principio en contextos humanitarios?
2. Fairness — <i>Ensuring AI tools treat all people equally, regardless of nationality, gender, race, background, etc.</i>		
fairness_importance	How important is this principle for AI use in humanitarian contexts?	¿Qué tan importante es este principio para el uso de IA en contextos humanitarios?
fairness_attention	How attentive is your work/field to this principle?	¿Qué tan atento es tu trabajo/campo a este principio?
fairness_responsibility	Who is primarily responsible for implementing this principle in humanitarian contexts?	¿Quién es el principal responsable de implementar este principio en contextos humanitarios?
3. Transparency — <i>Being clear about how AI tools work and who is responsible for decisions</i>		
transparency_importance	How important is this principle for AI use in humanitarian contexts?	¿Qué tan importante es este principio para el uso de IA en contextos humanitarios?
transparency_attention	How attentive is your work/field to this principle?	¿Qué tan atento es tu trabajo/campo a este principio?

Question name	English label	Spanish label
transparency_responsibility	Who is primarily responsible for implementing this principle in humanitarian contexts?	¿Quién es el principal responsable de implementar este principio en contextos humanitarios?
4. Professional Responsibility — <i>Having the right skills and knowledge to use AI tools properly and responsibly in humanitarian work</i>		
professional_importance	How important is this principle for AI use in humanitarian contexts?	¿Qué tan importante es este principio para el uso de IA en contextos humanitarios?
professional_attention	How attentive is your work/field to this principle?	¿Qué tan atento es tu trabajo/campo a este principio?
professional_responsibility	Who is primarily responsible for implementing this principle in humanitarian contexts?	¿Quién es el principal responsable de implementar este principio en contextos humanitarios?
5. Human Control — <i>Ensuring humans, not machines, make final decisions about people's lives</i>		
human_control_importance	How important is this principle for AI use in humanitarian contexts?	¿Qué tan importante es este principio para el uso de IA en contextos humanitarios?
human_control_attention	How attentive is your work/field to this principle?	¿Qué tan atento es tu trabajo/campo a este principio?
human_control_responsibility	Who is primarily responsible for implementing this principle in humanitarian contexts?	¿Quién es el principal responsable de implementar este principio en contextos humanitarios?
6. Safety and Security — <i>Protecting people from harm and ensuring AI tools don't create new risks</i>		
safety_importance	How important is this principle for AI use in humanitarian contexts?	¿Qué tan importante es este principio para el uso de IA en contextos humanitarios?
safety_attention	How attentive is your work/field to this principle?	¿Qué tan atento es tu trabajo/campo a este principio?
safety_responsibility	Who is primarily responsible for implementing this principle in humanitarian contexts?	¿Quién es el principal responsable de implementar este principio en contextos humanitarios?
Principle Ranking — All participants		
principle_ranking	Please rank these six principles in order of priority for AI use in humanitarian contexts.	Por favor ordena estos seis principios por orden de prioridad para el uso de IA en contextos humanitarios.

Table 14: Participant self-complete survey — XLSForm question names and bilingual labels

C Self-Assessment Questionnaire: Supplementary Tables

This appendix collects the full respondent-count tables underlying the self-assessment figures presented in the findings chapter. They are provided for completeness and verification; the analytically central statistics (the principle importance/attention ratings and the priority Borda scores, both with standard deviations) are tabulated inline alongside their figures.

C.1 Responsibility Attribution

Principle	Group	Humanitarian	AI developers	Government
<i>Privacy</i>	Practitioners	6	1	0
	Experts	3	1	0
<i>Fairness</i>	Practitioners	2	5	0
	Experts	2	2	0
<i>Transparency</i>	Practitioners	3	2	2
	Experts	3	0	1
<i>Professional responsibility</i>	Practitioners	7	0	0
	Experts	4	0	0
<i>Human control</i>	Practitioners	7	0	0
	Experts	3	1	0
<i>Safety and security</i>	Practitioners	3	2	2
	Experts	3	0	1

Table 15: Attribution of primary responsibility for each principle: respondent counts by group (humanitarian practitioners $n = 7$, AI experts $n = 4$), one choice per respondent per principle. Source: self-assessment questionnaire.

C.2 Practitioner Tooling and Organisational Context

Item	Count	% of $n = 7$
<i>Digital technologies used (multi-select)</i>		
Microsoft Forms/Excel	7	100%
KoboToolbox	6	86%
Google Forms/Sheets	5	71%
PowerBI	5	71%
ODK	2	29%
Tableau	1	14%
Python tools	1	14%
SPSS	1	14%
Other	1	14%
<i>Organisational AI-policy status (single choice)</i>		
Comprehensive AI policy	1	14%
Planned, not started	2	29%
No policies	3	43%
Don't know	1	14%
<i>Familiarity with peer AI initiatives (single choice)</i>		
Somewhat familiar	1	14%
Limited knowledge	2	29%
Not familiar	4	57%

Table 16: Practitioner sample ($n = 7$) tooling and organisational context: respondent counts and share of the sample; multi-select items sum to over 100%. Source: self-assessment questionnaire.

C.3 Practitioner Challenges, Support Needs, and Coordination Priorities

Item	Count	% of $n = 7$
<i>Most significant challenges to implementing AI ethically</i>		
Data sovereignty	7	100%
Culturally appropriate data	4	57%
Connectivity / infrastructure	3	43%
Community trust	2	29%
Local technical expertise	2	29%
Resource / funding limits	2	29%
Inter-organisation coordination	2	29%
Language barriers	1	14%
<i>Most valuable support for responsible AI (top-3 pick)</i>		
Training & capacity building	6	86%
Humanitarian-specific AI tools	5	71%
Shared ethical frameworks	3	43%
Community-engagement support	3	43%
Funding for responsible AI	2	29%
Government guidance	2	29%
<i>What would improve inter-agency coordination</i>		
Common data standards	6	86%
Shared ethical guidelines	5	71%
Joint training / workshops	5	71%
Shared tools & platforms	5	71%
Technical working groups	5	71%
Regular coordination meetings	3	43%
Collaborative funding	1	14%

Table 17: Practitioner sample ($n = 7$) perceived challenges, support needs and coordination priorities: respondent counts and share of the sample; all three items are multi-select, so counts sum to over 100%. Source: self-assessment questionnaire.

D Qualitative Coding Catalogue

D.1 Coded-segment catalogue

D.1.1 HP01 — Humanitarian practitioners (13 segments)

D.1.1.1 Role & experience role_experience_hp

HP01-Q1-S1

ES. *“yo hago parte del equipo de coordinación en Colombia del programa Together... yo hago el acompañamiento de estos socios, que son cinco organizaciones locales en diferentes regiones del país, y yo les hago el acompañamiento para hacer garantizar que las metas y los indicadores del proyecto se cumplan.”*

EN. *“I am part of the coordination team in Colombia for the Together programme... I accompany these partners, which are five local organisations in different regions of the country, and I support them to ensure that the project's targets and indicators are met.”*

Weights. – **Inductive.** –

HP01-Q1-S2

ES. *“Yo llegué al proyecto en agosto del 2023 y esa realmente, desde agosto del 2023 a la fecha de hoy, es mi experiencia trabajando con programas de ayuda humanitaria. Anteriormente trabajaba... con instituciones gubernamentales. En temas también manejaba temas de proyectos, seguimiento, presupuestos, pero desde el gobierno.”*

EN. *“I joined the project in August 2023 and that, really, from August 2023 to today, is my experience working with humanitarian assistance programmes. Previously I worked... with government institutions. There I also handled project management, monitoring, budgets, but from the government side.”*

Weights. – **Inductive.** –

D.1.1.2 AI engagement ai_engagement_hp

HP01-Q2-S1

ES. *“sobre todo de trad- herramientas que sirven de traducción porque como digo, pues trabajamos el proyecto tiene presencia en ocho países y pues el idioma común de todos es el inglés, sin embargo, pues está el alemán y hay muchos documentos que nos llegan en alemán, entonces nos toca hacer la traducción. Y pues hay otros países como en Pakistán o en- en Myanmar que tienen idiomas diferentes”*

EN. *“Mainly tools that serve for translation, because as I say, the project has a presence in eight countries and the common language for all of them is English, however there is also German, and many documents arrive in German, so we have to translate them... there are other countries like Pakistan or Myanmar that have different languages.”*

D.1.3.4 AI risks ai_risks_hp

HP03-Q4-S1

ES. *“hay un tema de riesgos de pronto el tema de los datos, puede que se pueda estar subiendo datos que sean pues de las personas, que si bien tenemos el consentimiento informado por ejemplo a nivel de la organización, pues ya es un tercero, ¿no? Es una plataforma que uno sí dice "bueno, ¿qué va a pasar con estos datos?". Incluso es una pregunta que nos hacíamos con Kobo. ¿Cuántos datos están cargados en... y que confiamos por la tradición, pero tenemos como la misma duda ahí: a dónde llega esta información”*

EN. *“There is a risk issue, perhaps the topic of data — that data belonging to people may be being uploaded; while we have informed consent at the organisational level, it goes to a third party, doesn't it? It is a platform where you do say 'well, what is going to happen with this data?' This is even a question we asked about Kobo. How much data is loaded there... and we trust it out of tradition, but we have the same doubt: where does this information end up?”*

Weights. PRIV·xxx, TRANS·xx, PROF-RES·xx, SAF·x, TECH-C0·xx **Inductive.** –

HP03-Q4-S2

ES. *“Riesgos también, por ejemplo, en falsear información, crear información. Lo digo desde nivel nacional. Nosotros que hacemos como todo el seguimiento y a veces la información viene de territorio, ¿cuánta información es realmente lo que está pasando o es algo que se crea sin, digamos, sin un contexto simple? Y a nosotros eso nos genera una tarea adicional y es la verificación de esa información. Y no caer en lo mismo, entonces tomo estos datos y lo paso por una IA y entonces qué hace: una IA generando datos y analizando sus propios datos. ¿Qué tanta validez puede tener la información?”*

EN. *“Risks too, for example, in falsifying information, creating information. I say this from the national level. We do all the monitoring and sometimes information comes from the field — how much of it is really what is happening or is something created without, let's say, without any real context? And that creates an additional task for us: verifying that information. And not falling into the same thing — taking that data and running it through an AI and then what does it happen? An AI generating data and analysing its own data. How much validity can that information have?”*

Weights. FAIR·x, TRANS·xx, PROF-RES·xx, HUM-CON·xx, SAF·xxx, TECH-C0·xx **Inductive.** –

HP03-Q4-S3

ES. *“hay algunas barreras también en algunos territorios en el no acceso a la tecnología y ese, eso podría ser un riesgo en términos de las brechas. Porque entonces el que puede avanzar y toma esta tecnología avanza muy rápido, pero el que se va a quedar se va a mantener ahí... actualmente nos pasa, nosotros tenemos trabajo en Arauca, trabajo en Buenaventura y son lugares donde la señal, la tecnología no está tan... Entonces uno dice "bueno, aquí qué tan prioritario es esto o tal vez la IA la apliquemos desde lo nacional con datos más brutos desde territorio”*

EN. *“There are also barriers in some territories around lack of access to technology — and that could be a risk in terms of the gaps. Because then those who can advance and adopt this technology advance very quickly, while those who will be left behind will stay there... this happens to us now: we have work in Arauca, work in Buenaventura, and these are places where signal and technology are not so... So you say 'well, how much of a priority is this here, or maybe AI is applied at the national level with rougher data from the field'.”*

Weights. FAIR·xxx, SAF·x, TECH-C0·xxx **Inductive.** digital_literacy_gap

HP03-Q4-S4

ES. *“también puede existir que se busque información y la información sea inventada. Entonces también para las personas de los migrantes que busquen alguna información, confiar en esa información también puede ser un riesgo que los lleve a lugares de riesgo inclusive.”*

EN. *“It can also happen that information is sought and the information is fabricated. So also for migrants who search for some information, trusting that information can also be a risk that leads them even to places of danger.”*

Weights. SAF·xxx **Inductive.** –

HP03-Q4-S5

ES. “puede ser un tema de datos institucionales. Hasta qué punto por ejemplo las guías metodológicas, los programas que se tienen a nivel programático como línea técnica. Que pues lo que muchos hacen a veces es como subir la información al sistema para que te haga lecturas de. Riesgos por ejemplo en temas legales, contratos, temas jurídicos que si se utiliza para hacer convenios y todo esto podría generarte dificultades o poner en riesgo la organización. Se vuelve un tema de los datos, ¿no? Como qué es de la organización y qué es público para otras personas que se puede utilizar, qué no... no lo siento tan claro.”

EN. “It could be a matter of institutional data. To what extent, for example, methodological guides, programmes held at the programmatic level as a technical line... what many do sometimes is upload information to the system for it to read. Risks, for example, in legal matters, contracts, legal topics — if used to draft agreements, this could create difficulties or put the organisation at risk. It becomes a matter of data, right? Like what belongs to the organisation and what is public and can be used by others, what cannot... I don't feel this is very clear.”

Weights. PRIV·xxx, TRANS·xxx, HUM-CON·xx, SAF·x **Inductive.** accountability_gap

HP03-Q4-S6

ES. “alguien que no hace parte de la organización y que solo está de paso, más porque hoy en día con lo que pasó con Estados Unidos y el recorte financiero, claro muchas personas cambiaron de trabajo y migraron de organización a organización... el que tenía la información de uno bien, entonces ahora está no sé en NRC y entonces empieza de pronto esta información que está en un chat de... empieza a mezclarse y empieza a estar en todo lado... No sabemos cómo vaya a evolucionar todo mucho más adelante porque ahoritica en lo que yo he leído sé que Chat ya está ahoritica como facilitando el tema de agentes para flujo de información. Entonces con eso ya hay acceso a bases de datos, entonces en qué momento alguien va a poder demandar a la organización porque sus datos están en algún lado o puedan tener acceso.”

EN. “Someone who is not part of the organisation and is just passing through — especially because today, with what happened with the United States and the financial cuts, many people changed jobs and migrated from organisation to organisation... the one who had your information well, they are now at NRC, I don't know, and then this information that's in a chat starts to mix and ends up everywhere... We don't know how all this will evolve further down the line because from what I've read, ChatGPT is right now facilitating agents for information flows. And with that there is already access to databases — so at what point will someone be able to sue the organisation because their data is somewhere or can be accessed?”

D.1.3.5 Humanitarian responsibilities humanitarian_responsibilities_hp

HP03-Q5-S1

ES. “el tema de la responsabilidad de las organizaciones es un poco hacer pedagogía frente al uso de la inteligencia artificial. Su uso tanto a nivel institucional como por parte de los usuarios o las personas acompañadas. La integración en diferentes instrumentos también que se puedan generar dentro de la organización, más por todo el avance tan rápido que está teniendo la IA. Digamos que implica un... pues como es lo que viene, es una adaptación también al proceso pues de los cambios que se han generado. Entonces creo que una responsabilidad porque pues finalmente el que no se vaya adaptando, pues va a tener menos ventajas a nivel de otras organizaciones: financiación, mostrar resultados o ser más eficientes con los resultados.”

EN. “The issue of organisational responsibility is partly to deliver pedagogy around AI use. Its use both at the institutional level and on the part of users or the people accompanied. Also integration into the different instruments that can be generated within the organisation, given how fast AI is advancing. This implies a... well, as it's what is coming, it also involves adapting to the changes that have been generated. I believe this is a responsibility because ultimately those who don't adapt will have fewer advantages relative to other organisations: funding, showing results, or being more efficient with results.”

Weights. PROF-RES·xxx, OPPOR·x, BRIDGE·xx, TECH-CO·xxx **Inductive.** donor_driven_adoption

HP03-Q5-S2

ES. “Creo... bueno, lo otro, crear sus propios prompts, es decir como hacer ingeniería de... de pues estas instrucciones propias de la organización y que puedan ser validadas por la misma organización, que responda. Ver en dónde se puede utilizar y puede optimizar el trabajo. Y pues la mayor acción de mitigación es una pedagogía responsable. Y pues que haya también algún lineamiento frente al uso de la IA y la tecnología.”

EN. “I think... well, the other thing: creating their own prompts — in other words, doing the engineering of... well, these organisation-specific instructions that can be validated by the organisation itself, that it responds to. Seeing where it can be used and can optimise work. And well, the biggest mitigation action is responsible pedagogy. And also that there is some guideline around AI and technology use.”

Weights. TRANS·x, PROF-RES·xxx, HUM-CON·xx, BRIDGE·xxx **Inductive.** –

D.1.3.6 Bridging solutions bridging_solutions

HP03-Q6-S1

ES. “Uno es pedagogía. Digamos ahí... yo creo que son dos: pedagogía y revisión. Sí, es decir, hay que promoverla pero también hay que revisar lo que se genera a partir de eso que llegue. Sí, y pues eso implica pues primero saber, primero que las organizaciones sepan cuál es el potencial de esto y los riesgos.”

EN. “One is pedagogy. Roughly speaking... I think there are two: pedagogy and review. Yes — that is, it needs to be promoted but also what is generated from it must be reviewed. Yes, and that implies first knowing — first that organisations understand what the potential of this is and the risks.”

Weights. PROF-RES·xxx, HUM-CON·xx, BRIDGE·xxx **Inductive.** –

HP03-Q6-S2

ES. “Y creo que el principio es pedagogía y revisión. Como si bien lo promovemos, debemos reflexionarlo lo que va generando y revisarlo tanto a nivel técnico como también esto lo voy a poner en términos ontológicos. Y es que personas también genera este tipo de IA, porque así como las personas modifican la IA, la IA está modificando a las personas. Entonces creo que esa relación implica aprender a usarla pero reflexionar, tener equipos que puedan reflexionar específicamente frente a esto. No simplemente sobre lo que llega, sino "venga, ¿cómo estamos usando estas herramientas”

EN. “And I think the principle is pedagogy and review. Just as we promote it, we must reflect on what it generates and review it — both at the technical level and also — I will put this in ontological terms — what kinds of persons this type of AI also generates, because just as people modify AI, AI is modifying people. So I think that relationship implies learning to use it but also reflecting: having teams that can reflect specifically on this. Not simply about what arrives, but: 'come on, how are we using these tools?'.”

ES. *“los que más desarrollan son como el área privada, los... inclusive el Estado desarrolla como más rápido este tema por la financiación que tiene y que no podemos desconocerlos. Entonces también creería que allí, cuando haces las tres preguntas de ¿quién es la responsabilidad: profesional, desarrolladores o el Estado? Y hay un punto en donde es de todos. O sea, es como todos tenemos que tener un pedazo y no desconocerlos.”*

EN. *“Those who develop the most are like the private sector... even the State develops this topic faster because of the funding it has, and we cannot ignore them. So I would also think there, when you ask the three questions about responsibility — professional, developers, or the State — there is a point where it belongs to everyone. That is: we all have to have a share and not ignore each other.”*

Weights. FAIR·x, PROF-RES·xxx, HUM-CON·xx, BRIDGE·x, TECH·CO·xxx **Inductive.** –

HP03-Q7-S5

ES. *“si la información llega más rápido se pueden tomar mejores decisiones. Porque en lo público, como está atravesado por lo político, a veces lo que ha pasado en este periodo presidencial, o sea eh, en la por ejemplo Unidad de Víctimas van como cuatro o cinco directores en menos de tres años. Entonces claro, y a veces son cargos donde no hay una competencia técnica. Es decir, la persona no necesariamente sabe. Y creo que la IA podría estar eh, mitigando el daño de la política, ¿no? Y es dando herramientas y juicios mucho más centrados en datos para tomar decisiones y no solo al criterio de una persona. Que el riesgo es que quién toma la decisión al final, y creo que un poco las preguntas que hacías ahí decía claro, ¿quién toma la decisión al final? Eso sería lo que agregaría a la entrevista.”*

EN. *“If information arrives faster, better decisions can be made. Because in the public sector, since it is pervaded by politics — sometimes what has happened in this presidential term — for example at the Victims Unit there have been around four or five directors in under three years. And sometimes these are positions without technical competency. That is, the person doesn't necessarily know. And I think AI could be mitigating the political damage, right? By providing tools and judgements much more centred on data to make decisions and not only on the criterion of one person. But the risk is: who makes the final decision? And I think some of the questions you were asking there — it was clear: who makes the final decision at the end? That is what I would add to the interview.”*

D.1.6.4 AI risks ai_risks_hp

HP06-Q4-S1

ES. *“Cuando uno trabaja en el sector humanitario, eh la información que uno recopila en el territorio es altamente mmm vulnerable. Es una información muy muy tiene que tener un cierto riesgo, o sea, un cierto manejo especial porque es una información muy muy muy privada, ¿sí? Que si se llega a exponer, claramente tiene riesgos la persona beneficiaria de las actividades como también la organización. Entonces, digamos que sí es un riesgo potencial con el uso de estas tecnologías porque de alguna u otra manera—bueno, desde mi conocimiento no sé si está salvaguardada 100% la información, aunque no lo creo porque pues en los sistemas cualquier cosa es vulnerable. Entonces es un nivel alto de riesgo.”*

EN. *“When you work in the humanitarian sector, the information you gather in the territory is highly vulnerable. It is information that requires special handling because it is very, very private — if it were to be exposed, it clearly presents risks for the beneficiary as well as for the organisation. So yes, this is a potential risk with the use of these technologies, because — from my knowledge — I don't know if information is 100% safeguarded, and I don't think it is, because in any system, anything can be vulnerable. So it is a high level of risk.”*

Weights. PRIV·xxx, TRANS·xx, PROF-RES·xx, HUM-CON·x, SAF·xxx **Inductive.** –

HP06-Q4-S2

ES. *“Sin embargo, nosotros optamos por lo que te digo, eh no dinamizar el contexto puntual, sino más bien llevarlo a un contexto eh paralelo. Sí, no decir las cosas eh detalladas ni nada por el estilo, sino más bien llevarlas a un contexto paralelo para evitar y minimizar riesgos. Entonces, básicamente eso. Porque dentro de nosotros del contexto de nosotros en el territorio encontramos eh casos de abuso sexual, violencia basada en género, desplazamientos, muertes, eh combates y demás. Entonces, sí—ahora, hay participantes de de las actividades que han si- han pertenecido a grupos al margen de la ley. Entonces, es bastante vulnerable esa información y debe estar siempre siempre salvaguardada.”*

EN. *“However, what we do is not to share the specific context, but rather take it to a parallel framing. Not to state things in detail, but rather to bring them to a parallel context to avoid and minimise risks. Because within our territory we encounter cases of sexual abuse, gender-based violence, displacement, deaths, combat, and so on. And there are participants who have been associated with armed groups at the margin of the law. So this information is extremely vulnerable and must always be safeguarded.”*

Weights. PRIV·xxx, FAIR·x, PROF-RES·xxx, HUM-CON·xx, SAF·xxx, TECH-CO·x **Inductive.** parallel_context_strategy

D.1.6.5 Humanitarian responsibilities humanitarian_responsibilities_hp

HP06-Q5-S1

ES. *“Digamos que como profesional cuando ingresé a [interviewee's organization]—que es la organización en la que trabajo—ellos tienen varios lineamientos. Sí, de hecho la información sí o sí debe ser confidencial y no se debe compartir a ningún ente externo. Sin embargo, en las dinámicas que ha evolucionado la tecnología, digamos que hace cuatro años no era el boom de la IA todavía, en los últimos años sí hemos tocado temas eh con respecto a la privacidad de datos, al respecto de la privacidad de información y hemos sido optimizando lo que te contaba anteriormente: no detallar el caso puntual, sino hacerlo de manera eh paralela.”*

EN. *“As a professional, when I joined [interviewee's organization] — the organisation where I work — they have various guidelines. Information must be confidential and must not be shared with any external entity. However, as technology has evolved — four years ago AI wasn't yet a boom — in recent years we have discussed topics related to data privacy and information privacy, and we have been optimising what I described earlier: not detailing the specific case, but doing it in a parallel way.”*

Weights. PRIV·xx, PROF-RES·xxx, SAF·x, BRIDGE·xx **Inductive.** parallel_context_strategy

HP06-Q5-S2

ES. *“Y claramente eh es una responsabilidad y un manejo de información y una cultura que se debe tener al manejar las IA. Mmm... es un concepto alto. Yo creo que eh todas las organizaciones independientemente en el contexto humanitario se deben de acoplar a esto. Porque sí o sí todas las organizaciones manejan información sensible, ya sean de costos, ya sean de información de personas, ya sea eh de compras, ventas, etcétera. Entonces yo creo que de aquí a un futuro va a haber también un protocolo de seguridad con la IA para poderla utilizar de manera responsable. Eh... ya.”*

EN. *“And clearly it is a responsibility, an information management matter, and a culture that must be cultivated when handling AI. It is a big concept. I think all organisations, regardless, in the humanitarian context should adapt to this. Because all organisations handle sensitive information — whether costs, personal information, purchases, sales, and so on. So I think that in the future there will also be a security protocol for AI to use it responsibly.”*

HP06-Q7-S3

ES. “Digamos también eh... agregarle el... bueno, el tipo de lenguaje porque el tipo de lenguaje humanitario eh es totalmente diferente al que utiliza ya ChatGPT y demás. Entonces lo que normalmente yo hago es pedirle "ven, ayúdame en este en esta pregunta". Entonces eh... ChatGPT lo envía con un lenguaje coloquial. Pero dentro del informe a los donantes y demás debe tener algunas variables que se deben cumplir sí o sí. Un ejemplo: dentro de la organización no podemos decir "los menores de edad". Sí, allá se dicen "los niños, las niñas y los adolescentes". ¿Sí? Entonces eso no lo entienden casi las IAs. Entonces eso sería un valor agregado. Eh... otra cosa es que digamos que hay palabras dentro del sector humanitario que están un poquito eh entre comillas prohibidas. Que digamos como el eh... (pausa) ve, se me fue la paloma... eh... "vinculación". Sí, "vinculación". Todas esas palabras que son que son entorno de riesgo, entonces deben de de irse con sinónimos en lenguajes netamente humanitarios. Okay. Entonces en vez de decir "vinculación", entonces eh... se está haciendo partícipe de actividades que llevan al al que la niña o el niño eh se promueva la participación en los grupos al margen de la ley”

EN. “Also — the language type. Humanitarian language is completely different from what ChatGPT and others use. When I ask it for help, ChatGPT responds in colloquial language. But within donor reports there are variables that must be met. For example: within the organisation we cannot say 'menores de edad' [minors by legal category]. The correct term is 'niños, niñas y adolescentes' [children, girls and adolescents]. Almost no AI understands this. That would be an added value. Also, there are words in the humanitarian sector that are somewhat 'prohibited' — for example 'vinculación' [lit. 'linking'; sector term for child recruitment into armed groups]. All those risk-environment words must be replaced with synonyms in purely humanitarian language. Instead of saying 'vinculación', one would say that the child is being induced to participate in activities that promote participation in armed groups at the margin of the law.”

HP07-Q2-S1

ES. “yo no soy técnica, ¿no? Yo no sé la parte muy técnica, pero yo creo que las herramientas están ahí para ayudar... [interviewee's organization], de hecho, para poder ejercer el trabajo, necesitaba inteligencia artificial. Nosotros nos encargábamos de recolectar voces cualitativas a escala de la gente y la única forma en la que puedes procesar eso, pues si lo quieres hacer de manera rápida, eficiente, es usando la tecnología. Entonces nosotros eh comenzamos a explorar inicialmente con esa tecnología disponible. Eh habíamos tenido antes de que todo este boom de estas herramientas saliera, teníamos un equipo que programaba algoritmos de machi- con machine learning y todo eso, pero luego cuando vino este boom comenzamos a tratar de entender cómo las podíamos usar”

EN. “I am not technical — I don't know the very technical side. But I believe the tools are there to help... [interviewee's organization], in fact, in order to carry out the work, needed artificial intelligence. We were responsible for collecting qualitative voices from people at scale, and the only way you can process that, if you want to do it quickly and efficiently, is by using technology. So we started to explore with available technology from the beginning. Before all this boom of these tools, we had a team programming machine learning algorithms and all that, but then when the boom came we started trying to understand how we could use them.”

Weights. PROF-RES·xxx, HUM-CON·x, OPPOR·xxx, TECH-CO·x **Inductive.** –

HP07-Q2-S2

ES. “siempre pensando que el uso para [interviewee's organization] iba a ser únicamente en el procesamiento de la información, no en la forma de recolectarla, para no perder el componente humano y ético, ¿no? Eh y que fuera simplemente un paso más dentro de todo nuestro proceso... siempre con auditoría en los distintos procesos, las fases de procesamiento... porque como nosotros trabajábamos con información pues de base primaria, o sea, las voces de la gente, los sistemas no estaban muy entrenados ni en el sector humanitario ni en ese tipo de voces. Entonces nos tocaba a nosotros iterar muchísimo.”

EN. “Always thinking that the use for [interviewee's organization] would be exclusively in the processing of information, not in the way of collecting it, so as not to lose the human and ethical component. And that it would simply be one more step within our entire process... always with auditing at the different processes, the processing phases... because since we worked with primary-source information — the voices of the people — the systems were not well trained on the humanitarian sector or on those types of voices. So we had to iterate a great deal.”

HP07-Q7-S1

ES. *“con la IA, un ejercicio bien hecho en el marco de ese framework ético que te digo, hay una oportunidad para que las poblaciones sí tengan ese poder y esa voz. Bien hecho, organizado... donde las mismas poblaciones pueden manejar herramientas, donde las mismas poblaciones pueden ser las que lideren procesos de recolección... nosotros lo que hacemos es elevar las voces. Para elevar las voces tienes que recoger las voces. Para recoger las voces tienes que entablar conversaciones, ¿cierto?, con guías semiestructuradas. Eso lo hacemos con las mismas poblaciones. Nosotros no contratamos gente técnica ni experta. Lo que hacemos es que nuestra metodología siempre fue tan fácil que la podíamos entregar a la misma población y que ellos la aplicaran para que ellos fueran agentes de su propio cambio. Y creo que con la IA eso va a ser más fácil, porque la IA te va a ayudar a quitar sesgos.”*

EN. *“With AI, a well-executed exercise within that ethical framework I mentioned, there is an opportunity for populations to truly have that power and that voice. Well done, organised... where the populations themselves can manage tools, where the populations themselves can be the ones who lead collection processes... what we do is elevate voices. To elevate voices you have to collect them. To collect them you have to have conversations, with semi-structured guides. We do this with the populations themselves. We don't hire technical or expert people. What we do is that our methodology was always simple enough that we could hand it over to the population itself so they could apply it and be agents of their own change. And I believe that with AI this will be easier, because AI will help remove biases.”*

D.1.9.1 Role & experience role_experience_exp

EXP02-Q1-S1

Quote. “I lead product development at [interviewee’s organization] and at [interviewee’s organization] we are responsible for helping organizations collect primary data, primarily in humanitarian response as well as development, global health and other contexts and we’ve integrated different AI tools over the last years including speech recognition and machine translation and we’re now adding a new feature for using large language models to support the analysis of open-ended text in surveys.”

Weights. OPPOR·xx **Inductive.** –

D.1.9.2 AI opportunities ai_opportunities_exp

EXP02-Q2-S1

Quote. “Large language models are good at helping with tasks that are requiring complex language interaction and so it opens up a wide front of applications that were previously outside the realm of automation or made automation quite difficult because natural language processing tools were, you know, able to do these tasks but not very high quality, not very reliable and certainly difficult to set up and so it enables a wide array of tasks”

Weights. FAIR·xx, PROF-RES·xx, HUM-CON·x, OPPOR·xx, TECH-CO·xx **Inductive.** –

EXP02-Q2-S2

Quote. “one of which we are leaning on for—for open-ended text analysis and it’s a good example because we were strongly—we were going to build this feature before LLMs came about and we were looking at various NLP techniques for doing this and in fact, five years ago we looked at transformers, what became GPT or part of GPT-3 as sort of the game changer there as a potential thing on the horizon. Um, but the technologies were going to be helpful there but they were certainly not as helpful and as quickly and as cheaply available for doing this kind of work. And I think that applies to a lot of other sectors where frankly people still have to figure out what the best use case is.”

Weights. PROF-RES·xx, OPPOR·xx **Inductive.** –

EXP02-Q2-S3

Quote. “The limitations are severe and having a tool that looks like it does good work because human language seems very high quality is deceptively practical until you realize it made a mistake. But yeah, I think the list of potential opportunities is long and we’re still trying to figure them out as a sector.”

Weights. FAIR·xx, TRANS·xx, PROF-RES·xxx, HUM-CON·xxx, SAF·xx, OPPOR·x **Inductive.** –

D.1.9.3 AI risks ai_risks_exp

EXP02-Q3-S1

Quote. “I think the biggest one is the lack of deterministic reliability. As opposed to, as I mentioned, other NLP tools, the LLMs are still a black box in the sense that they’re not fully understandable in how they get to a certain result, and we sometimes want very specific, very deterministic results, but we need to get there through reasoning. And we know at this point that LLMs on their own are just not the right tool, and we’re sort of desperately for something better. I think as a sector, as a technology sector, we want something that is better than just LLMs, which are just... very good bullshitting machines. The bullshitting tends to be good quality sometimes and very reliable sometimes, but not always. And that lack of ‘is it—is this one of the times that it’s accurate, is it one of the times that it’s bullshitting?’ makes it very hard.”

Weights. FAIR·xx, TRANS·xxx, PROF-RES·xx, HUM-CON·xx, SAF·xxx, TECH-CO·x **Inductive.** –

EXP02-Q3-S2

Quote. “And the gap of—of knowledge of ‘is this a domain that you as the operator, as the professional, actually know something about?’ makes this harder, because then you see some results that look extremely good and something vastly better than you at—ever would have come up with, but of course that doesn't mean it's accurate. In fact, the risk of inaccuracy increases tremendously.”

Weights. FAIR·x, PROF-RES·xx, HUM-CON·xx, SAF·xx, TECH-CO·xx **Inductive.** –

EXP02-Q3-S3

Quote. “So, as a whole, the risk is that the sector adopts these tools because it's understaffed, the sector is underfunded, and in need of support for complex tasks—tasks that require human reasoning and human knowledge—and this is a tool that seemingly does the job well in almost any domain, but because it only does it well up to a point, and errors creep in at various rates, the task of verifying that the LLM did actually do the task correctly... if you—if you spin that all the way to the end and you say everything has to be double-checked, then you might as well do the work yourself. So truly risk-free LLM usage doesn't exist.”

Weights. PROF-RES·xx, HUM-CON·xx, SAF·xxx, TECH-CO·x **Inductive.** HITL_as_ethical_safeguard

EXP02-Q3-S4

Quote. “I think there's a risk that we accept here, and I think what I like to do is draw an analogy to hiring a new staff... And I think that's how LLMs should be treated in that supervising them is an important task and it should be clear that the AI reports to the human in charge, and the human in charge has to be—have the right credentials and the abilities to actually supervise and verify their work. And if they don't verify their work, it's the human who is responsible and their job is on the line. But of course, because these tools are not real people on payroll and on the organigram, whether they were involved and whether their output was checked is—is extremely intransparent. And I think as a sector, the risk is for any... yeah, any sector really, not just the humanitarian sector, is allowing everyone to use these tools and relying on them without thinking through the ways of creating accountability and supervision feedback loops.”

Weights. FAIR·x, TRANS·xxx, PROF-RES·xxx, HUM-CON·xxx, SAF·x, BRIDGE·xx, TECH-CO·xx **Inductive.** accountability_delegation

D.1.9.4 Ethical priorities ethical_priorities_exp

EXP02-Q4-S1

Quote. “Well, as you know, we've done a rigorous literature analysis to try to answer that question because the truth is there are no ethical codes ready to go for this task. In fact, when I looked into it, ethical guidelines are really—really hard to find. What we consider ethical guidelines or principles in humanitarian response are just kind of statements of principles that have come up historically, but they're not ethical guidelines in their own right. Some of them are working principles; they're stating at a high level why we do what we do, like the humanity principles. They define at a very, very narrow operational point of view that we should be neutral and impartial. I think the only ethical principle within the four humanitarian principles is the one about, I guess, impartiality—it's the one which is kind of mapping onto the justice principle.”

Weights. FAIR·x, PROF-RES·xx, HUM-CON·x, BRIDGE·x, TECH-CO·x **Inductive.** –

EXP02-Q4-S2

Quote. “So what we found in the literature review is that there are specific risks, and I would rather focus on ethical risks: things that can go wrong because you do something. If you never leave your house, you never do any work, your risk profile is very low. So by putting ourselves out there and being humanitarians helping people, we make concessions, we make risks every single day—nothing to do with AI. Just by helping people, we might get it wrong. We might give it to the wrong person; we might give a disproportionate amount of aid to a certain group because we were biased in our data collection, we were biased in our own way of seeing the world.”

Weights. FAIR·xx, PROF-RES·xx, SAF·xx, BRIDGE·x, TECH-CO·xx **Inductive.** governance_gap

EXP02-Q4-S3

Quote. *“And all of these risks are particularly high once we collect data. So data processing of affected people in general heightens the risk because a single data point from an interview purports to represent perhaps an entire group, an entire village, and it might prioritize a certain intervention such as malnutrition feeding centers and so on, which are based on a small number of data points, and then you extrapolate—and you have to do that because it’s not practical to survey every person, so you do sampling. So even before AI, we have to understand... that... there are particular specific risks, ethical risks related to data processing in humanitarian response. Any data we collect and we process, we analyze, depending on how we do it and what tools we use, particular risks creep in: data privacy, data sovereignty, lack of—of consent”*

Weights. PRIV·xxx, FAIR·xx, PROF-RES·xx, SAF·xx, TECH-C0·xx **Inductive.** –

EXP02-Q4-S4

Quote. *“We grouped them into four buckets, so we use the bioethical principles which I found to be the most useful way of doing that—so autonomy, beneficence, non-maleficence, and justice are great principles in the medical sphere to guide health practitioners on what to do and what not to do when helping patients, and I think humanitarian response is primarily about helping people, so it—it makes a lot of sense to use this grouping. Any other grouping would have worked as well, because at the end of the day, the 22 ethical risks we found are—they stand on their own.”*

Weights. FAIR·x, PROF-RES·xxx, SAF·xx, BRIDGE·xx **Inductive.** –

EXP02-Q4-S5

Quote. *“And when it comes to AI, the same 22 principles guide the work that we do at [interviewee’s organization]... as we design new features, as we think about rolling them out, um, it affects my thinking of are we —what are we doing on these principles. Some are fairly obvious, some are things that we then found during the design process, ‘we should probably do something a little better here; there’s a particular risk here that we need to design for, that we want to avoid.’ If we can’t reasonably avoid it through the feature, then we shouldn’t build the feature or we should totally rethink that.”*

Weights. PROF-RES·xxx, HUM-CON·x, SAF·xx, BRIDGE·xxx **Inductive.** –

EXP02-Q4-S6

Quote. *“The other thing that we did is of course look at usability and such things, and if the AI tool isn’t useful, then no one’s going to use it. So the risk is also—it’s not just building a tool that avoids risks; if it has real potential and it can enable us to build better tools to increase the quality and reach of humanitarian response... then it’s also an obligation for us to build useful tools, tools that people want to use, that do the job well... Some risk needs to be accepted and we need to be transparent about what the risk is, and users have to be transparent about what they’re willing to risk and making something actually as useful in practice.”*

Weights. TRANS·xx, PROF-RES·xxx, SAF·xx, OPPOR·x, BRIDGE·xx **Inductive.** –

D.1.9.5 Humanitarian responsibilities humanitarian_responsibilities_exp

EXP02-Q5-S1

Quote. *“if you can’t reasonably as—assure humanitarian users that what you’re putting out is low risk or that their usage of the tool will be low risk, whether that’s through features or through training or guidance, um, you shouldn’t build the feature. If you can’t roll it out safely and reliably, you shouldn’t roll it out at all. And any amount of research and safeguard protections that you can add in to reduce these risks is 100% necessary. And just by being able to vibe code something quickly and—and solving a problem at hand doesn’t mean you should do it”*

Weights. PROF-RES·xxx, SAF·xxx, BRIDGE·xxx **Inductive.** –

EXP02-Q5-S2

Quote. *“any use of AI, whether it’s to analyze data or to build tools, um, really has to go through a review. And it’s not just some guidance that happens within, as you said, the provider side; it has to happen by the organization that ends up using these tools. And it needs to be, in my view, supported through ethical training, because no guidance, no checklist is ever going to fulfill the need for critical thinking whether something is truly safe enough.”*

Weights. PROF-RES·xxx, HUM-CON·x, SAF·xx, BRIDGE·xxx **Inductive.** –

EXP02-Q5-S3

Quote. *“people need to have an ethical mindset about it because the tools keep shifting. So no data security, no IRB will ever catch up to have all the checkbox in place, and—and even if they try their very best, there will always be corner cases not caught by these very rigid procedures. And—and what we really need is everyone, not just the provider as you implied, but the—the provider, the organization, the end-user having an ethical mindset of what it means to be, um, yeah, safe in using these tools”*

Weights. TRANS·x, PROF-RES·xxx, SAF·xx, BRIDGE·xx, TECH-CO·x **Inductive.** –

EXP02-Q5-S4

Quote. *“no textbook and no rigid IT security questionnaire can replace critical thinking of 'should you do this thing you're about to do?' Um, and—and you will come to a decision. And if you decide yes, you will at least hopefully have made that determination based on more... deeper thinking rather than 'my boss said it was okay.' And I think that's the mindset we're in and we should get out of that”*

D.1.9.6 Bridging solutions bridging_solutions

EXP02-Q6-S1

Quote. *“AI's actually been used in humanitarian logistics for 10, 20 years, sort of machine learning and algorithmic planning of logistics has been a thing for years and it's I think helped the sector tremendously to be more efficient and less wasteful and pre-positioning and that kind of stuff is a great AI application, that's why I asked about LLMs because I think AI as a whole can already and has been making a huge contribution. Where it hasn't cracked the surface until LLMs came about is helping with the staff shortage and funding shortage for staff.”*

Weights. OPPOR·xx, BRIDGE·x, TECH-CO·x **Inductive.** –

EXP02-Q6-S2

Quote. *“Large language models can help with that second bit because yes, it can augment and it can replace certain staff but mostly it's augmenting staff. So the challenge remains that someone, as we said earlier, someone has to be responsible for using these tools and they need to know how to use these tools and they have to be accountable for using them and it puts more pressure on the sort of conductor, someone in the middle who knows how to use these tools and and use them to greater effect and they will be working in isolation rather than having two or three people work with them, they will be working on their own with different models and tools and they will be very—they will have to be very skilled and trained”*

Weights. PROF-RES·xxx, HUM-CON·xx, SAF·x, BRIDGE·xxx, TECH-CO·x **Inductive.** –

EXP02-Q6-S3

Quote. *“I think it's one of the few sectors where I think there's a full responsibility to push forward with these tools because of this imperative that we need to help but we don't have the means to do it... maybe we need to pay these conductors and very capable people more money so that they can be hired and working at humanitarian organizations. We need to invest not just in salaries but also in the technologies and tools and very much this is the frontier, like very few organizations have cracked this and know how to do it”*

Weights. FAIR·x, PROF-RES·xx, OPPOR·xx, BRIDGE·xxx, TECH-CO·xx **Inductive.** –

EXP02-Q6-S4

Quote. *“Or does the humanitarian sector push ahead and say, “We can be the pioneers of using high AI low labor ratios for saving money and augmenting the staff that we have?” And then we need to lean in full on with training and evaluations and frameworks and and that's I think there's a fork in the road and I think each organization has to sort of take that path on their own and and decide whether they want to be in one or the other camp”*

Weights. PROF-RES·xx, SAF·x, BRIDGE·xx **Inductive.** –

EXP02-Q6-S5

Quote. *“So the risk of maleficence of doing something unintentional, introducing risk because you’re moving too quickly gets higher. And the humanitarian imperative is not helping at all costs but finding a right balance... And and as a sector we don’t know how much risk is acceptable. Having any risk at all is generally thought of as okay, but how much is too much risk? How much is like unintended circumstances, “do no harm” doesn’t mean never have any chance of doing any harm. But it’s also not 50-50, so it’s not okay to have 50% benefit and 49% harm”*

Weights. FAIR·x, PROF-RES·xxx, SAF·xxx, TECH-CO·xx **Inductive.** –

EXP02-Q6-S6

Quote. *“The very clear counter-risk is that we are introducing a whole slew of new risks that have never been seen in the world, that never been documented and we may only find out after a few years just how much harm have we done because maybe we’ve systematically served the wrong populations or introduced massive biases in a country where a whole population group has been—has been harmed and because we did not support them with aid programs when we should have and we trusted an algorithm that that told us to de-prioritize them. And and sometimes these are micro, it’s not just like you either cause malnutrition or you don’t, no, it’s like maybe you’ve harmed five people and 10 people lost their lives or 15 children did not get life-saving or life-altering medication when they they should have and could have.”*

Weights. FAIR·xxx, PROF-RES·xxx, HUM-CON·x, SAF·xxx, TECH-CO·xxx **Inductive.** –

EXP02-Q6-S7

Quote. *“So there are decision-making frameworks for this that a humanitarian sector has never really embraced, like in public health or in medicine. There are ways to decide this and DALYs and QALYs are useful metrics to actually quantify these risks and and what is most useful. And I think any—any anything, any decision-making method for deciding what is an acceptable risk, both of doing it or not doing it, is better than than what we currently have, which is everyone kind of figuring out on their own. I think every organization has to figure it out on their own, but organizations in my view should embrace a more systematic rigorous way of evaluating this risk instead of leaving it up for for everyone, every team and individual to to do on their own.”*

Weights. PROF-RES·xxx, SAF·xx, BRIDGE·xxx, TECH-CO·x **Inductive.** –

D.1.9.7 Additional comments additional_comments

EXP02-Q7-S1

Quote. *“Um, I mean, as I hinted, my—I think the important question you didn’t ask is how do we get there and what do we need to do. Um, that’s perhaps not part of your research, but I think the—the real meat is we know the risks, or at least we—we start to see the risks, and we—we clearly see the opportunity, at least we think we do. But how to make actual changes within any organization—like if you’re Save the Children or MSF—grappling with these questions at different levels of the hierarchy, uh, different parts of the field and HQs and regional offices, this is really, really hard.”*

Weights. PROF-RES·xx, SAF·x, BRIDGE·xx, TECH-CO·x **Inductive.** –

EXP02-Q7-S2

Quote. *“And yeah, I guess I want to go—like, I’m really excited about your research, but the question is always: What do we do with this? What do we do differently? What do we start as an organization—at [interviewee’s organization], at SCI, whatever—to—concrete steps that we start doing or or not doing? And—and that’s obviously not the part of the researcher, but as an organization, I think we now have enough data... to say we kind of see both the risks and opportunity and we see what others are thinking, but what are we concretely changing in our day-to-day? I’m not seeing enough action there. And—and I think it will be each organization on their own—my survey questions reflect that—each humanitarian organization has to decide this on their own. And some will do a better job than others, and hopefully the some will learn from each other. But I have not seen any organization really be good on this front and or at least talk about what they’re going to do.”*

D.1.11.4 Ethical priorities ethical_priorities_exp

EXP04-Q4-S1

Quote. “the first thing as an organization and also as an individual, I think it’s understand the problem that we are trying to solve... and what’s kind of the end-user of the tool that we are developing. Having that in mind, it’s easier to—and also ideally some sort of metric of success—so let’s say 50% of reduction on time of analysis, or 20% more of... community be uh accessing to the services, and so on. So once you have that in mind, I think it’s easier to measure or to identify those risk points that you have in the process”

Weights. FAIR·x, TRANS·x, PROF-RES·xxx, OPPOR·x, BRIDGE·xx, TECH-CO·x **Inductive.** –

EXP04-Q4-S2

Quote. “The ethical considerations could be anything from: okay, if we are developing something... regarding GBV response, or children, or let’s say just bringing primary data into the systems, how we can make sure that, for example, cannot be uh identifiable people uh in the system. So some sort of anonymization process that you can kind of, yeah, uh make sure that—that the information is not going through the system”

Weights. PRIV·xxx, TRANS·x, PROF-RES·xx, HUM-CON·x, SAF·xx, TECH-CO·x **Inductive.** –

EXP04-Q4-S3

Quote. “if you have, let’s say, context-specific information... LLMs, they cannot know what the context nuances are—I think having local partners and people... in that context can also provide a lot of uh support. For example, with the SitReps... we launched it in Myanmar uh right before the earthquake... when the earthquake happened, uh we were able to start producing data right away... We were told to start adding local news, which... the context. But very quickly, because of the human-in-the-loop and this human verification, there were ethical concerns in regards of propaganda being kind of announced in those local news. So it’s as easy as: okay, when the analysts or the people on the field read it and identified it in the tool, they flag it and then we internally kind of iterate”

Weights. FAIR·x, TRANS·x, PROF-RES·xx, HUM-CON·xxx, SAF·x, OPPOR·xx, TECH-CO·x **Inductive.** context_mismatch, HITL_as_ethical_safeguard

EXP04-Q4-S4

Quote. “it’s difficult to pre—or to anticipate everything that could happen. So but you can kind of start building on top of some lessons learned from others in the sector. But I think honestly the best thing is to very quickly iterate—again, kind of start small... to kind of have the—if... any danger... rather than deploying it to a whole community or a whole country that probably could be affected without kind of testing it before... Always ask yourself if AI is completely necessary or not. Sometimes even other kind of, yeah, technology could be enough... but now everyone is kind of thinking: okay, how I can put AI on this”

Weights. PROF-RES·xxx, HUM-CON·x, SAF·xx, BRIDGE·x, TECH-CO·xx **Inductive.** solutionism

EXP04-Q4-S5

Quote. “what happens if something goes wrong? Is there any kind of opportunity for the community, for the user, to kind of raise the hand and say: okay, look, this is something that is not good. So yeah, everything about feedback loops it’s key. And then being able to either plug—or take the plug off and—and say: okay, we’re shutting down the service, or we’re just enhancing it and iterating it as fast as we can because we identified that—that risk”

D.1.11.5 Humanitarian responsibilities humanitarian_responsibilities_exp

EXP04-Q5-S1

Quote. “AI is now the let’s say the word that everyone is using. Before probably was APIs... I’m seeing something similar happening with AI, it’s like yeah, AI is not only the ChatGPT conversation that you have or it’s—it’s more than that. So either the organization build capacity internally in their tech teams to kind of understand what they are doing, or they find some partners that can collaborate with them”

Weights. TRANS·x, PROF-RES·xxx, BRIDGE·xx **Inductive.** capacity_constraints

EXP04-Q5-S2

Quote. “I know it’s difficult... in the humanitarian sector, everything needs to be free and it’s kind of for granted that you will have access to it, it’s open source and yeah, this ideal world of everyone is collaborating and doing stuff. But that’s not reality... someone needs to pay for the cloud services, for the maintenance... funders and donors they just fund sometimes like pilots for six months and not in the longer run, so I do see kind of an issue there”

Weights. PROF-RES·xx, BRIDGE·x, TECH-CO·xxx **Inductive.** donor_driven_adoption, capacity_constraints

EXP04-Q5-S3

Quote. “we are responsible, we also need to be uh, aware of what we are bringing... to the teams, and be able to train them, to test them in safe environments, to let them also go wrong. I mean, if they—they kind of find something that is not working... that’s exactly what we want to have kind of those edge cases... AI is coming—or not coming, is already here—and yes or yes it will be replacing a lot of the things that we are doing, either if we want to kind of be aware or concerned of it or not.” “I mean, uh you can see... in the private sector, tech sector, layoffs and everything because now AI can replace coders, uh graphic designers, and so on. So yeah, I think it’s always about: yes, we are dealing with people, there are high stakes in the sector, but we cannot be blind of: okay, this is already there. How we can just be prepared, be uh educated on it, and make... the best informed decisions with data”

Weights. TRANS· xx, PROF-RES· xxx, HUM-CON· xx, SAF· x, TECH-CO· x **Inductive.** AI_displacement, institutional_inertia

D.1.11.6 Bridging solutions bridging_solutions

EXP04-Q6-S1

Quote. “The first one, and going back to a previous kind of answer, it’s about educating the organizations technically on what AI means and the risks that are behind it. You will see in my—my answers as well of the form, I think professionalism for me is kind of the top one. Once you understand what you’re dealing with, you’re able to measure transparency, fairness, and all of those other dimensions. Before that, if you don’t understand what you’re dealing with... you’re just probably falling on the traps of the news, the media, what the colleagues said about an answer that they got from AI, from GPT or from Claude, uh, without knowing how they prompted or what the model they were using”

Weights. FAIR·x, TRANS·xx, PROF-RES·xxx, HUM-CON·x, SAF·x, BRIDGE·xxx **Inductive.** capacity_constraints

EXP04-Q6-S2

Quote. *“having the tools built in-house... to assess uh the AI, it’s key. It’s—for me, it’s mandatory. Either, again, they build capacities internally with their tech teams—I know NGOs, or—or let’s say in humanitarian sector, uh, many organizations the tech team is more IT-related with kind of servers and emails... but I do think the need of having more uh yeah kind of informed people in their teams. And of course, trainings as well for the different staff members and the different levels of audiences in the—the organization. Or if they don’t want to kind of have people in-house, they can of course partner with uh vendors or uh organizations that can support them”*

Weights. PROF-RES·xxx, HUM-CON·x, SAF·x, BRIDGE·xxx, TECH-CO·xx **Inductive.** capacity_constraints

EXP04-Q6-S3

Quote. *“the second that is linked to that... is I think the best way of testing AI... is to have commercial partners... we cannot —and probably you will hear this next week in Geneva: it’s like this dream of having an LLM trained for the humanitarian sector and uh Switzerland kind of tried to do that, but when you play with it it’s really bad and—and it’s difficult. Even if they have the budget, it’s difficult to catch up with the big tech companies. We don’t have 100 billion dollars—last week OpenAI just raised from NVIDIA, SoftBank, uh and Amazon—I mean, you cannot compare that to asking and begging for 1 million in the humanitarian sector”*

Weights. PROF-RES·xx, BRIDGE·xxx, TECH-CO·xx **Inductive.** donor_driven_adoption

EXP04-Q6-S4

Quote. *“So how you can make sure that transparency, fairness, and all of that is reflected into the tools? Just partnering with AWS, with Google, with Microsoft, and working hand-by-hand with them. If they seem too big, okay, let’s take one step probably uh back and say: okay, what are their... commercial partners that they have in each of the countries and start working with them? But yeah, this kind of idea of we want everything open-source and—and yeah this ideal world... it’s honestly is not sustainable over time... Anthropic or OpenAI can start shifting into this NGO sector and asking and being more open to, okay, either reducing the price of the licenses or getting closer to UN uh and so on. But I think there is so many yeah things on the mindset of the traditional humanitarian to still to be changed to be open to... with those uh partners”*

Weights. FAIR·x, TRANS·xx, SAF·xx, BRIDGE·xxx, TECH-CO·xxx **Inductive.** institutional_inertia

EXP04-Q6-S5

Quote. *“And I think the third thing... is about curiosity... foster the curiosity from the different team members in organizations. I think somehow the sector as well is very colonial in the way that HQ is sending... idea of the localization has been on the paper for the last five years maybe and yes, there is the push of building local capacities and so on, but what happens if the innovation is happening from them and letting them to play around, to test those tools, again, in safe environments, sandboxes, uh and then just push that towards HQ that I think makes more sense rather than just people sitting in Geneva or New York trying to guess what are the issues that, I don’t know, someone in a settlement in Kenya is having”*

Weights. FAIR·xx, PROF-RES·xx, HUM-CON·x, OPPOR·x, BRIDGE·xx, TECH-CO·xxx **Inductive.** localization_gap

D.1.11.7 Additional comments additional_comments

EXP04-Q7-S1

Quote. *“I think the adoption—and last week we were presenting the findings from the HLA... survey... you see somehow more adoption, or the adoption being quickly growing in the global south rather than in... the global north. Probably... good and not good—sometimes it’s good because you see more people testing it, kind of providing more learnings, use cases and so on. But it’s not good that is sometimes is—it’s fostered because there are not many policies or guardrails or governance kind of frameworks, so people just are free to kind of use it”*

Weights. PRIV·xx, FAIR·x, PROF-RES·xx, SAF·xx, OPPOR·x, TECH-CO·xxx **Inductive.** governance_gap

EXP04-Q7-S2

Quote. *“I think there is a key opportunity to kind of, yeah, foster accelerators or incubators in these different countries... and I think there is technical capacity, there is kind of the skillsets that are needed, and start thinking that is if it’s again not happening in Geneva or in the US, is—is not good quality... I would love to see more projects coming from yeah, all of these kind of countries in—in the global south and kind of expanding and also challenging the status quo of the more traditional approaches in the sector”*

Weights. FAIR· xx, PROF-RES· xx, OPPOR· xxx, BRIDGE· xxx, TECH-CO· xxx **Inductive.** localization_gap, localization_gap

E Humanitarian AI Use-Cases Curated by NetHope

The table below shows the list of the humanitarian AI use-cases curated by NetHope and is discussed in Section 5.2.7.

Use case	Organisation(s)
Child safeguarding and content vetting	Plan International Canada ³⁰
Qualitative data transcription and coding	KoboToolbox ³¹
Organisational knowledge retrieval (RAG chat-bots)	Mercy Corps; Norwegian Refugee Council ³²
Cross-system data harmonisation for anticipatory action	Norwegian Refugee Council (CLEAR) ³³
Hazard monitoring and disaster decision support	Pacific Disaster Center ³⁴
Market and food-price prediction	Catholic Relief Services ³⁵
Misinformation/infodemic monitoring	WHO (AIRA) ³⁶
Population mapping for crisis response	ICRC (with EPFL and ETH Zürich) ³⁷
Anticipatory cash transfers triggered by AI forecasts	GiveDirectly (with Google Research) ³⁸
Internal generative AI chatbots for safe/private use	Mercy Corps ³⁹
AI-assisted satellite/aerial mapping	Humanitarian OpenStreetMap Team ⁴⁰
Displacement forecasting	Danish Refugee Council ⁴¹
Generative AI chatbots for affected populations	Signpost AI (IRC, Mercy Corps) ⁴²

F Informed Consent Form (English)

This research examines how humanitarian practitioners and AI experts understand ethical principles for implementing AI technologies, particularly Large Language Models (LLMs), in migration contexts in Colombia. The findings may contribute to the development of responsible AI frameworks, tools and training materials for humanitarian organizations.

F.1 Introduction

My name is Josh and I am a Master's student in the NOHA International Humanitarian Action programme at the University of Groningen. I am conducting research on how AI technologies, particularly large language models (LLMs), might be used ethically in humanitarian contexts such as supporting migrants in Colombia.

F.2 Participation Information

What is involved: Your participation will involve a 45–60 minute interview about ethical considerations when implementing AI technologies in migration contexts. The interview will include questions about your perspectives on principles such as data privacy, fairness, transparency, and human control. You will also be asked to rate the importance, ethical risks, and operational benefits of various principles. The interview will include specific questions about AI tools for analyzing qualitative data and collaborative frameworks for responsible technology use in Colombia.

Why you were selected: You have been invited because of your professional experience and knowledge in either humanitarian work with organizations supporting migrants in Colombia or AI technology development with potential humanitarian applications.

Voluntary participation: Your participation is entirely voluntary. You are free to withdraw at any point during the interview or up to two weeks after the interview without giving any reason. If you decide to withdraw, all data collected from you will be deleted.

Interview format: Interviews with participants in Colombia will be conducted in person when possible, or via secure video conferencing if necessary. For participants in Europe or other regions, interviews will be conducted in person when possible, or via secure video conferencing.

Risks: The questions focus on professional perspectives rather than personal experiences. However, if any question makes you uncomfortable, you may skip it, end the interview or withdraw consent.

Confidentiality: Your identity will be protected in all research outputs. Your responses will be anonymized during analysis, and you will not be identified in any publications or presentations. Only aggregated data or anonymized quotes will be shared.

Data protection: Interviews will be audio recorded with your permission. If audio recorded, the interviews may be transcribed using automated speech-to-text software to assist with analysis. For interviews conducted in Spanish, automated translation tools may be used to translate content to English. All data, including recordings, transcriptions, and translations, will be stored securely on encrypted and password-protected devices. The audio recordings will not be made available for reuse and will be deleted after 6 months from collection. Personal identifying information will be separated from interview data and stored separately. Raw data will be deleted after 5 years.

Cross-border data handling: As this research involves participants from Colombia, Europe, and possibly other regions, your data may be transferred and stored across international borders. All transfers will comply with relevant data protection regulations in Colombia and the European General Data Protection Regulation (GDPR) where applicable.

Language and accessibility: This consent form is available in Spanish and English. You may request the form in your preferred language, and interviews can be conducted in Spanish or English according to your preference.

Regional legal rights: Participants from the European Economic Area have specific rights under GDPR, including the right to access, rectify, and erase their personal data. Colombian participants have rights under Law 1581 of 2012, including the right to know, update, and rectify information. All participants retain these rights regardless of where data is processed.

Results sharing: The findings will be presented in my Master's thesis and may be published in academic journals or presented at conferences. I will also prepare a summary of findings that will be shared with participants who express interest. If you have any questions or concerns about this research, please contact the researcher, supervisor or ethics committee:

Position	Name	Email
Researcher	Joshua Beretta	joshuaberetta@gmail.com
Research Supervisor	Dr Malcolm Campbell-Verduyn	m.a.campbell-verduyn@rug.nl
NOHA Ethics Committee	Jolanda Dijkstra	noha-ethicscommittee@rug.nl

F.3 Consent Declaration

#	Statement	Confirma- tion
1	I confirm that I have read and understand the information provided about this research. I have had the opportunity to consider the information, ask questions, and have had these answered satisfactorily.	
2	I understand that my participation is voluntary and that I am free to withdraw at any time, without giving any reason, up until two weeks after the interview.	
3	I understand who will have access to my data, how it will be stored, and what will happen to it at the end of the project.	
4	I understand that I will not be personally identifiable in any research outputs.	
5	I consent to the interview being audio recorded (The audio recordings will not be made available for reuse and will be deleted 6 months after collection)	
6	I consent to the use of automated speech-to-text software to transcribe my interview recording	
7	I consent to the use of automated translation tools to translate interview content between Spanish and English	
8	I agree with the use of anonymized quotations in research outputs. (<i>Optional</i>)	
9	I understand that my data may be transferred across international borders and will be protected according to relevant data protection laws in my country and internationally.	
10	I understand how to raise a concern or make a complaint.	
11	I agree to take part in this research study.	
12	I would like to receive a summary of the research findings. (<i>Optional</i>)

G Formulario de Consentimiento Informado (Español)

Esta investigación examina cómo los trabajadores humanitarios y expertos en IA entienden los principios éticos para implementar tecnologías de inteligencia artificial, particularmente Modelos de Lenguaje Extenso (LLMs, por sus siglas en inglés), en contextos de migración en Colombia. Los resultados pueden contribuir al desarrollo de marcos, herramientas y materiales de capacitación sobre IA responsable para organizaciones humanitarias.

G.1 Introducción

Me llamo Josh y soy estudiante de maestría en el programa NOHA de Acción Humanitaria Internacional en la Universidad de Groningen. Estoy realizando una investigación sobre cómo las tecnologías de IA, en particular los modelos de lenguaje extensos (LLMs), podrían usarse de manera ética en contextos humanitarios, como el apoyo a migrantes en Colombia.

G.2 Información sobre la participación

En qué consiste: Tu participación implicará una entrevista de 45–60 minutos sobre consideraciones éticas al implementar tecnologías de IA en contextos de migración. La entrevista incluirá preguntas sobre tus perspectivas en torno a principios como privacidad de los datos, equidad, transparencia y control humano. También se te pedirá que evalúes la importancia, los riesgos éticos y los beneficios operativos de varios principios. La entrevista incluirá preguntas específicas sobre herramientas de IA para analizar datos cualitativos y marcos de colaboración para un uso responsable de la tecnología en Colombia.

Por qué fuiste seleccionado/a: Has sido invitado/a debido a tu experiencia profesional y conocimiento, ya sea en el trabajo humanitario con organizaciones que apoyan a migrantes en Colombia o en el desarrollo de tecnologías de IA con posibles aplicaciones humanitarias.

Participación voluntaria: Tu participación es completamente voluntaria. Eres libre de retirarte en cualquier momento durante la entrevista o hasta dos semanas después de la misma, sin necesidad de dar ninguna razón. Si decides retirarte, todos los datos recopilados de ti serán eliminados.

Formato de la entrevista: Las entrevistas con participantes en Colombia se realizarán en persona siempre que sea posible, o por videoconferencia segura si fuera necesario. Para participantes en Europa u otras regiones, las entrevistas

también se realizarán en persona cuando sea posible, o por videoconferencia segura.

Riesgos: Las preguntas se centran en perspectivas profesionales y no en experiencias personales. Sin embargo, si alguna pregunta te resulta incómoda, puedes omitirla, terminar la entrevista o retirar tu consentimiento.

Confidencialidad: Tu identidad estará protegida en todos los resultados de la investigación. Tus respuestas serán anonimizadas durante el análisis, y no serás identificado/a en publicaciones ni presentaciones. Solo se compartirán datos agregados o citas anonimizadas.

Protección de datos: Las entrevistas se grabarán en audio con tu permiso. Si se graban, podrán ser transcritas mediante programas automáticos de reconocimiento de voz para ayudar en el análisis. Para entrevistas en español, podrían usarse herramientas automáticas de traducción al inglés. Todos los datos, incluidas grabaciones, transcripciones y traducciones, serán almacenados de forma segura en dispositivos encriptados y protegidos con contraseña. Las grabaciones de audio no estarán disponibles para reutilización y se eliminarán a los 6 meses de su recopilación. La información personal identificable se separará de los datos de la entrevista y se almacenará aparte. Los datos en bruto se eliminarán después de 5 años.

Manejo de datos transfronterizo: Como esta investigación involucra participantes de Colombia, Europa y posiblemente otras regiones, tus datos podrían ser transferidos y almacenados a través de fronteras internacionales. Todas las transferencias cumplirán con las regulaciones de protección de datos pertinentes en Colombia y con el Reglamento General de Protección de Datos (GDPR) de la Unión Europea cuando corresponda.

Idioma y accesibilidad: Este formulario de consentimiento está disponible en español e inglés. Puedes solicitarlo en tu idioma preferido, y las entrevistas se pueden realizar en español o inglés según tu elección.

Derechos legales regionales: Los participantes del Espacio Económico Europeo tienen derechos específicos bajo el GDPR, incluyendo el derecho a acceder, rectificar y borrar sus datos personales. Los participantes en Colombia tienen derechos bajo la Ley 1581 de 2012, incluyendo el derecho a conocer, actualizar y rectificar información. Todos los participantes mantienen estos derechos sin importar dónde se procesen los datos.

Compartir resultados: Los hallazgos se presentarán en mi tesis de maestría y podrán publicarse en revistas académicas o presentarse en conferencias. También prepararé un resumen de resultados que se compartirá con los participantes que expresen interés.

Si tienes preguntas o inquietudes sobre esta investigación, puedes ponerte en contacto con el investigador, el supervisor o el comité de ética:

G.3 Declaración de Consentimiento

#	Declaración	Confirma- ción
1	Confirmando que he leído y comprendido la información proporcionada sobre esta investigación. He tenido la oportunidad de analizarla, hacer preguntas y obtener respuestas satisfactorias.	
2	Entiendo que mi participación es voluntaria y que soy libre de retirarme en cualquier momento, sin dar ninguna razón, hasta dos semanas después de la entrevista.	
3	Entiendo quién tendrá acceso a mis datos, cómo se almacenarán y qué pasará con ellos al final del proyecto.	
4	Entiendo que no seré personalmente identificable en ningún resultado de investigación.	
5	Doy mi consentimiento para que la entrevista se grabe en audio (las grabaciones de audio no estarán disponibles para su reutilización y se eliminarán 6 meses después de su recopilación)	
6	Doy mi consentimiento para el uso de software automatizado de conversión de voz a texto para transcribir la grabación de mi entrevista	
7	Doy mi consentimiento para el uso de herramientas de traducción automática para traducir el contenido de la entrevista entre español e inglés	
8	Estoy de acuerdo con el uso de citas anónimas en los resultados de investigación. <i>(Opcional)</i>	
9	Entiendo que mis datos pueden transferirse a través de fronteras internacionales y estarán protegidos de acuerdo con las leyes de protección de datos pertinentes en mi país e internacionalmente.	
10	Entiendo cómo plantear una inquietud o presentar una queja.	
11	Acepto participar en este estudio de investigación.	
12	Me gustaría recibir un resumen de los resultados de la investigación. <i>(Opcional)</i>

H Recruitment Email Template (English)

Subject: Invitation to Participate in Research on AI in Humanitarian Work

Body:

Hi [Name],

My name is Joshua Beretta, and I'm reaching out from the University of Groningen and KoboToolbox to invite you to participate in research examining AI use in humanitarian work.

I'm conducting my Master's thesis research that examines how humanitarian practitioners and AI experts interpret and apply ethical frameworks for AI implementation in migration contexts. This research will support the development of practical frameworks for responsible AI use in the humanitarian sector.

[Paragraph highlighting familiarity with the recipient's work and relevance to the research topic, e.g., "Given your work with [some organisation or tool] and expertise in AI applications for humanitarian contexts, your perspective would be invaluable to this study."]

I would like to invite you to a 30-45 minute remote interview to share your insights on:

- Current AI/LLM technologies with humanitarian applications
- Ethical considerations in developing AI tools for vulnerable populations
- Challenges and opportunities in humanitarian AI implementation
- Bridging technical and humanitarian perspectives on responsible AI use

Interview details:

- Format: Remote (video call)
- Duration: 30-45 minutes
- Timing: Flexible to accommodate your schedule over the coming weeks

Conditions:

- Participation is completely voluntary and confidential
- You may withdraw at any time
- Ethical approval obtained from University of Groningen
- You will receive a summary of findings if desired

Would you be interested in participating? I'm happy to work around your availability.

Please let me know if you have any questions.

Best,

Josh

*Masters Student, NOHA International Humanitarian Action
Univeristy of Groningen*

In collaboration with KoboToolbox

Note: *This research is academically independent but supports Kobo's mission to develop responsible AI tools. All data will be handled confidentially and in accordance with GDPR regulations.*

I Recruitment Email Template (Español)

Subject: Invitación a participar en investigación sobre IA en el trabajo humanitario

Body:

Hola a tod@s,

Espero que se encuentren bien. Soy Joshua Beretta y me pongo en contacto desde la Universidad de Groningen y KoboToolbox para invitarles a participar en una investigación sobre el uso de inteligencia artificial en el trabajo humanitario.

Estoy desarrollando una tesis de maestría (Universidad de Groningen) que examina cómo los profesionales humanitarios interpretan y aplican marcos éticos para el uso de IA en contextos de migración. Esta investigación apoyará el desarrollo de marcos prácticos de IA responsable para el sector humanitario.

Les invito a una entrevista de 45-60 minutos para compartir sus perspectivas sobre:

- Uso actual de tecnologías digitales/IA en su trabajo
- Consideraciones éticas en la implementación de nuevas tecnologías
- Desafíos y oportunidades en el contexto de asistencia a migrantes

Modalidades disponibles:

- Remota: Durante las próximas semanas (flexible con su horario)
- Presencial: En Bogotá durante octubre-noviembre 2025

Condiciones:

- Participación completamente voluntaria y anónima
- Pueden retirarse en cualquier momento
- Aprobación ética de mi universidad
- Recibirán resumen de hallazgos si lo desean

Su experiencia trabajando en contextos humanitarios en Colombia proporciona insights únicos sobre la aplicación práctica y ética de herramientas de IA.

¿Estarían interesados en participar? Puedo adaptarme a su disponibilidad y preferencia (remota/presencial).

Quedo disponible para responder cualquier pregunta.

P.D.: Si conocen colegas que podrían estar interesados en este tema, agradeceré mucho si pudieran compartir mi contacto.

Un cordial saludo,

Joshua Beretta

—

Estudiante de Maestría, NOHA International Humanitarian Action
Universidad de Groningen, Países Bajos
